Toff Fullish'd, 1041

H E Infruitor; or Young Man's Best Companion : Containing Spelling, Reading, Writing, and Arithetick, in an easier Way than any jet published; and how qualify any Person for Business, without the Help of a lafter. Instructions to write Variety of Hands, with opies both in Profe and Verse, how to write Letters on ufiness or Friendship; Forms of Indertures, Bonds Bills Sale, Receipts, Wills, Leates, Releates, Oc. Alfo lerchants Accompts, and a fhort and easy Method of hop and Book keeping with a Description of the Product, ountries and Market-Towns in England and Wales, Tother with the Carpenters plain and exact Rule: Shewg how to measure Carpenters, Joyners, Sangers, Irickvers, Plaisterers, Plummers, Masons, Glasters, and Painrs Work; how to undertake each Work, and at what rice; the Rates of each Commodity, and the common lages of Journey-men; with Cunter's Line, and Goggeall's Description of the Sliding Rule. Likewise the Fraccal Guager made easy; the Art of Dialling, and how to ect and fix the same; with Instructions for Daing, Couring, and making Colours; and fome general Obfertions for Gardening every Month in the Year. To which added, The Family's Best Companion, with Instructifor Marking on Linnen; how to Pickle and Preserve, make diverse Sorts of Wines, and many excellent Plaiers and Medicines necessary in all Families. By George ther, Accomptant. London, Printed for A. Bettfworth d C. Hitch at the Red Lyin; and J. Osborn, at the olden Ball in Pater-Nofter Row; J. Birt, at the Bible d Ballin Avemary Lane; and J. H dges, at the Lockg-Glass on London-Bridge. Price 2 s. 6 d.

rgenious Cocker, now to Rest thou'rt gone,
No Art can show thee sully, but thine own.
I by rare Arithmetick, alone can show,
It' vast Sums of Thanks, we for thy Labours own.

Attrange 11811

Cocker's

BEING

A plain and familiar Method, suitable to the meanest Capacity, for the full Understanding of that incomparable Art, as it is now taught by the ablest School-Masters in CITY and COUNTRY.

COMPOSED

By EDWARD COCKER, late Practitioner in the Arts of Writing, Arithmetick, and Engraving: Being that follong fince promised to the World.

Perused and Published,

By JOHN HAWKINS, Writing-Master near St. George's Church in Southwark, by the Author's correct Copy, and commended to the World by many eminent Mathematicians and Writing-Masters in and near London.

The FORTY-SIXTHEDITION, carefully Corrected and Amended.

By GEORGE FISHER, Accompt. Licensed Sept. 3. 1677. Roger L'Estrange.

London: Printed for A. Bettsworth and C. Hitch at the Red-Lym, and J. Osbern at the Golden-Ball in Pater-Noster-Row; S. Birt, at the Bible and Ball in Avenary-Lane; and J. Hoges, at the Locking glass on London Bridge.

TI OWNE

TO his much honoured Friends Manwaring Davies of the Inner Temple, Esq; and Mr. Humphry Davies of St. Mary Newington-Butts, in the County of Surrey.

Favours) humbly dedicateth his Manuel of Arith-

metick.

To the READER.

Courteous Reader.

Having had the Happiness of an intimate Acquaintance with Mr. Cocker in his Life-time, often follfcited him to remember his Promise to the World, of publishing his Arithmetick; (but for Reasons best known to himself) he refused it; and after his Death) the Copy falling accidentally into my Hand) I thought it not convenient to smother a Work of so considerable a Moment, not questioning but it might be as kindly at p. ted, as if it had been prefented by his own Hand. The Method is familiar and easy, discovering as well the Theorick as the Practick of that necessary Art of Vulgar Arithmetick. And in this new Edition there are many remarkable Alterations for the Benefit of the Teacher or Learner, which I hope will be very acceptable to the World: I have also performed my Fromise, in Publithing the Decimal Frithmetick, which finds Encouragement to my Expectation, and the Booksellers too. I am thine to ferve thee.

John Hawkins.

Mr.

Mr. Edward Cocker's

BY the secret Influence of Divine Providence, I have been instrumental to the Benefit of many, by Vertue of those useful Arts, Writing and Engraving: And do now with the same wonted Alacrity, cast this my Arithmetical Mite into the publick Trasury, beseching the Almighty to grant the like Blessing to these as to my furmer Labours.

Seven Sciences supremely excellent,
Are the chief Stars in Wisdom's Firmament:
Whereof Arithmetick is one, whose Worth
The Beams of Profit and Delight shine forth;
This crowns the reft, this makes Man's Mind compleat,
This treats of Numbers, and of this we treat.

I bave been often defired by my intimate Friends, to pubish something on this Subject, who, in a pleasing Freedom, have fignified to me, that they expelled it would be extrardinary. How far I have answered their Expectation, I now not; but this I know, That I have designed this Work not extraordinary abstrufe or profound; but bave, by all Means possible, within the Circumference of my Capacity, endeavoured to render it extraordinary useful to all those, whose Occasions shall induce them to make use of Numbers. If it be objected, That the Books already published, treating of Numbers, are innumerable; I answer, That's but a small Wonder, since the Art is infinite. But that there hould be formany excellent Tracts of Practical Arithmetick tant, and so little prastised, is to me a great Wonder; knowing that as Merchandize is the Life of the Weal publick, fo Practical Arithmetick is the Soul of Merchandize. Therefore I do ingeniously profess, That in the Beginning of this Undertaking, the numerous Concerns of the bonoured Merchant

The Proeme or Preface.

Merchant first possesset my Consideration: And bow far I have accommodated this Composure for his most worthy Ser-

vice, let bis own prefitable Experience be Judge.

Secondly, For your Service, most excellent Profesors, whose Understandings soar to the Sublimity of the Theory and Practice of this noble Science, was this Arithmetical Trastate composed; which you may please to employ as a Monitor to instruct your y ung Tyrous, and thereby take Occasion to referve your precious Moments, which might be exhausted that Way, for your more important Assairs.

CHAP. I.

Notation of Numbers.

Rithmetick is an Art of Numbering or Knowledge, which teacheth to Number well. And there are diverse Species and Kinds of Arithmetick and Geometry, the which we do intend to treat of order, applying the Principles of the one to the Definion of the other. For as Greatness is the Subject of Gecetry, so Number is the Subject of Arithmetick; and it then their first Principles and chief Fundamentals mult ve like Definitions; or, at least some Congruency. 2. Number is that, by which the Quantity of any Thing xpressed or numbered; as the Unit is the Number by ich the Quantity of the Thing is expressed or said to be , and two by which it is named two, and half, by ich it is named or called half, and the Root of 3, 17 123 ich it is called the Root of 3, the like of any other. 126 . Hence it is that Unit is Number; for the Part is of 129 same Matter that is his Whole, the Unit is part of the 130 littude of Units, therefore the Unit is of the fame 138 tter, that is the Multitude of Units; but the Matter 145 the Multitude of Units is Number; therefore the 140 tter of Unit is Number; for elfe, if from a Number 148 149 en no Number be subtracted, the Number given re-149 beth; as suppose 3 the given Number, if as some sup-153 e must remain 3 still; which is very abfurd.
166 there it will be convenient to the part. 151 I be no Number, then if you subtract I from 3, Hence it will be convenient to examine from whence

ther hath its Rife or Beginning. Most Authors mainthat Unit is the Beginning of Number, and it felf no ber; but looking upon the Principles and Definitions e first Rudiments of Geometry, we shall find that the 174 178

Definiti. 9

Definition of a Point is in no way congruous with the De finition of an Unit in Arithmetick; and therefore One of Unit must be in the Bounds or Limits of Number, and con fequently the Beginning of Number is not to be found in the Number 1; wherefore making Number and Magni tude congruent in Principles, and like in Definitions, we make and constitute a Cypher to be the Beginning of Number, or rather the Medium between increasing and decreasing Numbers, commonly called absolute or whole Numbers, and negative and fractional Numbers, between which nothing can be imagin'd more agreeable to the Defini tion of a Point in Geometry; for as a Point is an Adjund of Line, and it self no Line, so is a (0) Cypher an Adjund of Number, and it felf no Number: And as a Point is Geometry cannot be divided or increased into Parts; Tikewise (0) cannot be divided or increased into Parts For as many Points, though in Number infinite, do make no Line, fo many (0) Cyphers, though in Number in finite, do make no Number. For the Line A B cannot be increased by the Addition of the Point C, neither the Number D be increased by the Addition of the (0) Cypher E; for if you add Nothing to 6, the Sum will be 6, (0) Cypher neither increasing nor diminishing the Number 6; but if it be granted that A B be extended or prolonged Sum to the Point C, fo that A C be made a continued Line, then A B is increased by the Addition of the Point C. In like manner, if eve grant D (6) be prolonged to E (0), fo DE 60 that D E (60) be a continued Number, 6 0 making 60, then 6 is augmented by the Aid of (0) as constituting the Number (60) Sixty; a furthermore that I or Unit is material, and a Number, a that (0) is the Beginning of Number, is proved by all A thors, although directly; for the Tables of Signs and Tables gents prove one Degree to be a Number, because the S of 1 Degree is 174524, (the Radius being 100000 and the Beginning of the Table is (0), and it answere 90000, Uc.

P

25

H

fo

Ri

tai

fies

pre

3 F

5. Hence it is that Number is not Quanity discontinued, for that which is but one Quantity, is not Quantity difjunct: (60) Sixty, as it is a Number, is one Quantity, viz. one Number (60) Sixty; therefore as it is a Number, it is not Quantity disjunct, for Number is some such Thing in Magnitude, as Humidity in Water: for as Humidity extends it self through all and every Part of Water, so Number related to Magnitude, do extend it self through all and every Part of Magnitude. Also, as continued Water doth answer continued Humidity, so to a continued Magnitude doth answer a continued Number. the continued Humidity of an intire Water, suffereth the same Division and Distinction that his Water doth; so the continued Number suffereth the same Division and Distinction that his Magnitude doth. And thus much concerning the Definition and Principles of Number and Magnitude. We come now to treat of,

6. The Characters or Notes by which Numbers are fignified, or by which a Number is ordinarily expressed; and they are these, viz. (o) Cypher or Nothing, 1 One, 2 Two, 3 Three, 4 Four, 5 Five, 6 Six, 7 Seven, 8 Eight, 9 Nine. The Cypher, which though of itself it expressed not any certain or known Quantity, yet is the Beginning or Root of Number, and the other 9 Figures are called figni-

ficant Figures or Digits.

7. In Number of any Sort, two Things are to be confi-

dered, viz. Notation and Numeration.

8. Notation teacheth how to describe any Number by certain Notes and Characters, and to declare the Value thereof, being so described, that is by Degrees and Periods.

9. A Degree confilts of three Figures, viz. Of three Places, comprehending Units, Tens, and Hundreds, so 265 is a Degree, and the first Figure (5) on the right Hand, stands simply for his own Value, being Units, or so many Ones, viz. Fi.e; the second in order from the Right, signifies as many times Ten as there are Units contained in it, viz. Sixty; the Third in the same Order signifies so many Hundreds as it contains Units, so will the Expression of the Number be Three hundred fixty five, co.

3 Figures or Places, and whose proper Order is to prick

every third Place, beginning at the right Hand, and so on to the Left; so the Number 63452 being given, it will be distinguished thus, 63,452, and expressed thus; Sixty three thousand, four hundred sifty two; likewise 4,578, 236,782, being distinguished as you see, will be expressed thus; Four thousand, sive hundred seventy eight Millions, two hundred thirty six thousand, seven hundred eighty two.

11. Number is either Absolute or Negative.

12. Absolute or Intire, Whole, Increasing Number, is that by which annexing another Figure or Cypher, it becomes ten times as much as it stood for before; and if two Figures or Cyphers be annexed, it make an hundred times as much as it stood for before, &c. As if you annex to the Figure 6 a Cypher, then it will be (60) Sixty; so if two Cyphers are annexed, then it will be (600) Six hundred, and if you do annex to it (4) Four, then it will be (64) Sixty four; and if you annex (78) Seventy eight, it will be then (678) Six hundred seventy eight, &c.

13. A Negative, or Broken, Fractional, Decreafing Number, is that which by prefixing a Point or Prick toward the left Hand, its Value has decreased from so many Units, to so many tenth Parts of any Thing; and if a Point and (0) Cypher, or Digit, be prefixed, it will be then so many hundred Parts; and if a Point and two Cyphers or Digits be prefixed, its Value is decreased to be so many thousandth Parts; as if you would prefix before the Figure 3 a Point(.) or Prick thus (.3), it is then decreased from 3 Units or 3 Integers, to 3 tenth Parts of an Unit or an Integer: And if you prefix a Point and Cypher thus (.03,) it is decreased from 3 Integers to 3 hundred Parts of an Integer; and by this Means 5 1. absolute, by prefixing of a Point, will be decreased to .5 1. negative, which is 5 tenth Parts of a Pound, equal in Value to 10 Shillings, and fo by prefixing of more Cyphers or Digits, its Value is decreased in a decuple Porportion ad infinitum. As in the following Scheme, or rather Order of Numbers, we have placed (0) Cypher in its due Place and Order, as it is in the Beginning and Medium of Number; for going from (a) towards the left Hand, you deal with intire, absolute, whoie, increasing Numbers.

In-

But going from (0) the Place of Units towards the right Hand, you meet with broken, negative, fractional, and decreasing Numbers. And hence it follows, that Multiplication increaseth the Product in absolute Numbers, but decreaseth the Product in negative Numbers. Also Division decreaseth the Quotient in whole Numbers, and increaseth it in negative fractional Numbers.

14. An absolute, intire, whole, increasing Number, hath always a Point annexed towards the right Hand;

and therefore,

15. A negative, broken, decimal, decreasing Number, hath always a Point prefixed towards the left Hand. When we express Integers or whole Numbers, as 5 Pounds, 5 Feet, 26 Men, we usually annex a Point or Prick after 1. feet. men. inch.

the Number thus, 5. 5. 26. 347.
But when we express Decimals, or Numbers that are de-

nied to be intire, or decreasing Numbers, we do commonly prefix a Point or Prick before the said Decimal or decreasing Number thus (.3), that is three Tenths, or 3 Primes; (.03) that is 3 Hundredths, or 3 Seconds.

16. A whole or absolute Number is a Unit, or a composed Multitude of Units, and it is either a Prime or else

a compound Number.

17. Prime Numbers amongst themselves, are those which have no Multitude of Units for a common Measure, as 8 and 7, or 10 and 13, because not any Multitude of Units can equally measure or divide them without a Remainder.

18. Compound Numbers amongst themselves, are those which have a Multitude of Units for a common Measurer, as 9 and 12, because 4 measures them exactly, and ab-

breviates them to three and four.

19. A broken Number commonly called a Fraction, is a Part or Parts of a whole Number, viz. A Part of an Integer, as \(\frac{1}{3}\) one Third, is one third Part of an Unit.

20. A broken Number or Fraction , confifts of 2 Parts,

viz. the Numerator and Denominator.

21. The Numerator and Denominator of a Fraction, and fet one over the other, with a Line between them; and the Numerator is fet above the Line, and expressent the Parts therein contained.

22. The Denominator of a Fraction, is the inferior Number placed below the Line, and expressent the Number of Parts, into which the Unit or Integer is divided; and let \(\frac{1}{2}\) be the Fraction given, so shall 3 be the Numerator, and doth express or Number the Multitude of Parts contained in this Fraction, for \(\frac{1}{2}\) is a Fraction compounded of Fourths or Quarters, and the Figure 3 in numbering shews us, that in that Fraction there are 3 of the 4th Parts or Quarters; also in the same Fraction \(\frac{1}{2}\) is the Denominator, and doth express the Quality of the Fraction, viz. that the whole or Integer is divided into 4 equal Parts.

23. A broken Number is either Proper or Improper; viz. proper when the Numerator is less then the Denominator, for $\frac{1}{4}$ is a perfect proper Fraction, but an improper Fraction hath its Numerator greater, or at least equal to the Denominator, thus $\frac{1}{3}$ is an improper Fraction, the

Reason is in given in the Definition.

24. A proper broken Number, is either Simple or Compound, viz. Simple when it hath one Denomination, and Compound when it confifteth of divers Denominations; if $\frac{3}{4}, \frac{6}{12}, \frac{1}{12}$ were given, we say, they are each of them Single or Simple Fractions, because they consist but of one Numerator, and one Denominator; but if $\frac{1}{4}$ of $\frac{1}{12}$ of of a Pound Sterling were given, we say that it is a compound broken Number or Fraction, because the Expression and Representation consistent of more Denominations than one; and such by some are called Fraction or Fractions; they have always this Particle (of) between them.

25. When a fingle broken Number or Fraction hath for his Denominator a Number confisting of a Unit in the first Place towards the left Hand, and nothing but Cyphers from the Unit towards the right Hand, it is then the more aptly

aptly and rightly called a decimal Fraction; under this Head are all our decreasing Numbers placed, and in our 13 the Definition, called Negatives; and by the Order there prescribed, we order them to be Decimals, by signing a Prick or Point before them, or the Numerator, rejecting the Denominator: Therefore according to our last Rule, $\frac{1}{2} \cdot \frac{1}{10} \cdot \frac{1}{2} \cdot \frac{1}{2}$

25 15 and 1 25 fland thus, .5, and .025.

But oftentimes, as in the second and fourth Fractions $\frac{1}{\sqrt{5}}$ and $\frac{1}{\sqrt{5}}$, a Prick or Point will not do without the Help of a Cypher or Cyphers perfixed before the significant Figures of the Numerator, and therefore when the Numerator of a decimal Fraction consistent not of so many Places as the Denominator hath Cyphers, fill up the void Places of the Numerator with perfixing Cyphers before the significant Figures of the Numerator, and then sign for a Decimal, so shall $\frac{1}{100}$ be .05, and $\frac{1}{100}$ will be .025, and $\frac{1}{100}$ will be .0072. Now by this we may easily discover the Denominator having the Numerator, for always the Denominator of any decimal Fraction consists of so many Cyphers, as the Numerator bath Places, with an Unit prefixed before the said Cypher, viz. under the Point or Prick.

26. A decimal Number or Fraction, is expressed by Primes, Seconds, Thirds, Fourths, &c. and is a Number decreasing. Here instead of natural and common Fractions, as \(\frac{3}{4} \) of a Thing, we order the Thing or Integer into Primes, Seconds, Thirds, Fourths, Fifths, &c. that our

Expression may be consonant to our former Order.

27. In decimal Arithmetick, we always imagine that all intire Units, Integers, and Things, are divided first into ten equal Parts, and these Parts so divided we call Primes; and Secondly, we divide also each of the former Primes into other ten equal Parts, and every one of these Divisions we call Seconds; and Thirdly, we divide each of the said Seconds into ten other equal Parts, and those so divided, we call Thirds; and so by decimating the former, and subdecimating these latter, we run on ad infinitum.

28. Let a Pound Sterling, Troy-weight, Averdupois weight, Liquid-measure, Dry-measure, Long-measure, Time, Dozen, or any other Thing or Integer be given to be decimally divided: In this Notion promiled, we ought to let the first Division be Primes, the next Division Seconds, the next Thirds, &c. So one Pound Sterling being 20 Shillings, when divided into ten equal Parts, the Value of each Part will be 2 Shillings, therefore one Prime of a Pound Sterling will stand thus (.1), which is in Value 2 Shillings; 3 primes will fland thus (.3), and that is in va-Jue 6 Shillings. Again, a Prime or 1 being divided into ten equal Parts, each of those Parts will be one Second, and is thus expressed (01,) and its Value will be found 2 d. Farthing, and - of a Farthing; and so will .05 fignify one Shilling or five Seconds. And if .or he divided into ten other equal Parts, each of those Parts so divided will be Thirds, and will stand thus .001, and its Value will be found to be 96 of a Farthing, or 186 of a Farthing, and .cog Thirds will be 2 d. and .64 of a Farthing, or 764 of a Farthing, Gc. So that .375, will be found to reprefent 7 s. 6 d. for the 3 Primes are 6 Shillings, and the 7 Seconds are 1 s. 4 d. and 70 of a Penny, and the 5 Thirds are I Penny, - of a Penny, both which added together

make 7 s. 6 d. 29. If you put any Bulk or Body, representing an Integer, if it be decimally divided, then the Parts in the first Decimation are Primes, the next Seconds, and the next Decimation is Thirds, the next Fourths, &c. As let there be given a Bullet of Lead, or fuch like, whose Weight let it be 50 1. Tray, this is called a Unit, Integer, or Thing; then will the like Weight and Matter make 10 other, the which together will be equal to 50 1. and will weigh each of them 5 1. a-piece; take of the same Matter, and equal to 5 l. make 10 more, then each of those weigh 6 Ounces a-piece; also, if again, you take 6 Ounces, and thereof make 10 other small Bullets, each of them will weigh 12 Penny-weight Troy; and thus have you made Primes, Seconds, and Thirds, in Respect of the Integer, containing 50 1. Troy-weight; so that 5 Primes is equal to the half Mass and 2 Primes, and 5 Seconds, is a Quarter of the Mass; and therefore one of the first Division,

3 OF

contains 61.3 Ounces.

test for Calculation.

2 of the fecond Division, and 5 of the third Division, will be equal in Weight to half a Quarter of the Mass, and

30. When a Decimal Fraction followeth a whole Number, you are to separate or part the Decimal from the whole Number by a Point or Prick; fo if 75 followed the whole Number 32, fet them thus, 32.75. You shall find that diverse Authors, have diverse ways in expressing mixt Numbers, as thus, 32 75, or 32 75, or 32 75, but you will find that 32.75 thus placed and expressed, is the fit-

31. A mixt Number hath two Parts, the whole, and the broken; the whole is that which is composed of Integers, and the broken is a Fraction annexed thereunto. So the mixt Number $36 + \frac{8}{12}$ being given, we say, that 36 is the whole Number, which is composed of Integers; and the , 3 is the broken Number annexed, which sheweth that one of the former Integers (of that 36) being divided into 12 Parts, 73, doth express 8 of those 12 Parts more, belonging to the faid 36 Integers.

32. Denominative Numbers are of one, or of many, and those are of diverse Sorts and Kinds, viz. Singular, called Unit, as 1; and Plural a Multitude, as 2, 3, 4,5; Single, of one Kind only called Digits, as 1, 2, 3, 4, 5, 6, 7, 8, 9; and Compounds of many, 10, 11, 12, 5c. 102,

CHAP. II.

Of the Natural Divisions of Integers, and the several Denominations of the Parts.

AND that we may advance methodically herein, we will begin with the main Pillars on which Arithmetick is founded, viz. the feveral Species of that Art: Lut first,

Of Money, Weights, &c.

2. The least Demonination or Fraction of Money used in England is a Farthing, from which is produced the following Table, called the Table of Coin, &c.

And therefore,

The First of these Tables, viz. that on the Lest Hand, is plain and easy to be understood, and therefore wants no Direction. In the second Table above the Line, you have 1 l. 20 s. 12 d. 4 grs. whereby is meant, That a Pound is equal to 20 Shillings, and 1 Shilling is equal to 12 Pence, and 1 Penny equal to 4 Farthings; under the Line is 1 l. 20 s. 240 d. 960 grs. which signifies 1 l. to contain 20 Shillings, or 240 Pence, or 960 Farthings; in the second Line below that is 1 s. 12 d. 48 grs. the First standing under the Denomination of Shillings, whereby is to be noted, that 1 Shilling is equal to 12 Pence or 48 Farthings; and likewise that below that, one Penny is equal in Value to four Farthings; understand the like Reason in all the sollowing Tables of Weight, Measure, Time, Motion, and Dozen.

And here note, That as the Hour is divided into Minutes, so each Minute is sub-divided into 60 Second and each Second into 60 Thirds, and each Third into 6 Fourths, Oc.

The Trophical Year, by the exactest Observation of the most accurate Astronomers, is found to be 365 Days, Hours, 49 Minutes, 4 Seconds, and 21 Thirds.

CHAP. III.

Of the Species or Kinds of Arithmetick.

There are several Species of this Art; and which ma gent be termed either Natural, Artificial, Analtyca Algebraical, Lineal, or Instrumental: But what we are and now to treat upon, relates to the fingle Parts of Natura Arithmetick, so far as concerns Numeration; of which Len there are also four Kinds, viz. Addition, Subtraction the Multiplication, and Division.

CHAP. IV.

Addition of Whole Numbers.

and: Ddition is the Reduction of two or more Numbers, of like Kind, together into one Sum or To tal: Or, it is that by which diverse Numbers are added together, to the End that the Sum or Total Value of them all may be discovered.

The first Number in every Addition is called the Addible Number; the other, the Number or Numbers added; and to be the Number invented by the Addition, is called the Ageogo gregate or Sum, containing the Value of the Addition.

mem The Collation of the Numbers, is the right placing the fine Numbers given respectively to each Denomination, and the the Operation is the artificial adding of the Numbers gives together, in order to the finding out of the Aggregate or Sum.

2. In Addition place the Numbers given respectively are the one above the other, in fuch fort, that the like De- inde gree, Place, or Denomination, may stand in the same at Series, viz. Units unde: Units, Tens under Tens, Hundreds under Hundreds, &c. Pounds under Pounds, Shillings

Chap. 4. Addition of, &c. under Shillings, Pence under Pence, Gr. Yards under Mards, Feet under Feet, Uc. ond 3. Having thus placed the Numbers given (as before) to 6 and drawn a Line under them, add them together, beginof the ning with the leffer Denomination, viz. at the right Hand; and fo on, subscribing the Sum under the Line s, respectively: As for Example, Let there be given 3352, and 213, and 133, to be added together. I fet the Units in each particular Number under each other, and so likewise the Tens under the Tens, Gc. and draw a Line under them, as in the Marma gent; then I begin at the Place of Units, and and thein together upwards, faying, 3 and ? are and 2 makes 8, which I set under the line, and under the same Figures added together; then thick I proceed to the next Place, being the Place of the line, and add them in the same Manner as I did in the Place of Units, faying, 3 and 1 are 4, and 5 are 9, which likewise set under the Line respectively; then I go to the Place of Hundreds, and add them up as I did the other, faying, 1 and 2 are 3, and 3 are 6, which is also a under the Line; and lastly, I go to the Place of Thoufands, and because there are no other Figures to add to the To Work is finished; and I find the Sum of the 3 given hem 4. But if the Sum of the Figures of any Series exceeddible the Excess above the Tens, and for every Ten carry one, and to be added to the next Series towards the Left Hand, and Ag to go on till you have finished your Addition; always ren. membering, that how great foever the Sum of the Figures the the last Series is, it must all be set down under the the time respectively. So 3678 being given to be added to iven 1357, I fet them down as is before directed, and as you e or a in the Margent, with a Line drawn under them, vely are 15, which is 5 above 10, wherefore I fet 5 2357 De inder the Line, and carry 1 for the 10 to be adfame to the next Series, faying, I that I carried and reds is 6, and 7 are 13, wherefore I fet down 3, ings and. nder

0 6

2]

e; he

an are fide

el

nen I 129

Shi

95

Pou

nd pr

ai

and carry I (for the Ten) to the next Series; then I fay 1 that I carried and 3 are 4, and 6 are 10, now, because fide it comes to just 10, and no more, I set o under the Line, Fart and carry I from the 10 to the next, and fay, I that I carried and 2 are 3, and 3 are 6, which I fee down in its respective Place; thus the Addition is ended, and the Total Sum of these Numbers is found to be 6035. Several Ten Examples of this Kind follow.

> Numbers to) 573846 785946 be added (347205 Sum 2061864

748647 Numbers to 465834 be added 648400 Sum 1939364

38074 Numbers to 8437 be added 923 76

Sum 92856 5. If the Numbers given to be added, are contained uning der divers Denominations, as of Pounds, Shillings, Pence Place and Farthings; or of Tuns, Hundreds, Quarters, Pounds and &c. Then in this Case, having disposed of the Numbers and each Denomination: under other of the like Kind; begin nich ning at the least Denomination (minding not) and having gr. Denomination do make an Integer in the next greater Desp. nomination that you find therein contained, bear an Unique in Mind to be added to the faid next greater Denominati ving on, expressing the Excess respectively under the Line; pro on, expressing the Excess respectively under the Line; produced in this Manner until your Addition be finished; the rain following Example will make the Rule plain to the rain Learner. Thus these following Sums being given to be added, viz. 136 l. 13 s. 04 d. 2 qrs. and 79 l. 07 s rry 10 d. 3 grs. and 33 l. 18 s. 09 d. 1 gr. alfo 15 l. 091 2 05 d. 0 grs. The Numbers being disposed according to Pe Order, will stand as in the Margent. Then I begin at the Denomination of Farthings, and add them up, faying,

ma

1

16

7

13

16

fay 2 3 are 4 and 2 makes 6. Now I cause of fider that fix Farthings are 1 Fenny ine farthings; wherefore I fet down nat le 2 Farthings in its place under the in its; and keep 1 in Mind to be added the the next Denomination of Pence: veral en I go on, faying, I that I car-

and 5 are 6, and 9 are 15, and are 25, and 4 are 29; now I

136-13-04-2 79-07-10-3 33-18-09-1 15-09-05-0 265-09-05-2

ofider that 29 Pence are 2 Shillings and 5 Pence, therere I fet down 5 Pence in order under the Line, and keep in Mind for the 2 Shillings to be added to the Shillings; hen I go on, faying, 2 that I carried and 9 are 11, and 18 re 29, and 7 are 36, and 13 are 49; then I confider that Shillings are 2 Pounds and 9 Shillings, wherefore I fet 9 Shillings under the Line, and carry the 2 for the 4 Pounds to the next and last Denomination of Pounds; nd proceed, faying, 2 that I carried and 5 makes 7, and hare 10, and 9 are 19, and 6 are 25; then I fet down 5, carry 2 for the 2 Tens; and proceed, faying, 2 that carry aud 1 is 3, and 3 are 6, and 7 are 13, and 3 make and I fet down 6, and carry I for the 10, and go on; untaring, I that I carried and I are 2, which I fet in its and the Sum of the aforesaid Numbers to be 265 1. 9 s. 's and 2 grs. Here is another Example in the Operation, of gin which the Learner must have an Eye to the Table of Troyon wight. The Numbers given are 38 l. 7 eq. 13 p. w. vintagr. and 50 l. 10 eq. 10 p. w. 12 gr. and 42 l. 08 eq. Do p. w. 26 gr. And in order to the Addition thereof, I Unit like them as you see, and proceed to the Operation; nativing, 16 and 12 are 28, and 18 are 46; now because productions make I Penny-weight, 46
the rains are I Penny-weight, and 22 l. eq. p.m. gr. the rains, therefore I set down 22, and 38-07-13-18 in hearty I for the Penny-weight, and 50-10-12-12 makes 6, and 10 are 16, and 13 42-08-09-16

g to Penny-weight. I fet down 9 in 132-02-09-22
the Place under the Line, and carg to the Ounces, faying, I that I carry and 8
are

Chap.

are 9, and 10 are 19, and 7 are 26, and because 26 Oun make 2 Pounds 2 Ounces, I set down 2 for the Ounce and carry 2 to the Pounds; going on, 2 that I carry 2 are 4, and 8 make 12, that is 2 and go 1; then 1 I carry and 4 are 5, and 5 are 10, and 3 are 13, which I down as in the Margent, and the Work is finished, and find the Sum of the said Numbers to amount to 132 207. 2 p. w. 22 gr. The Way of proving these, or a Sum in this Rule, is shewed immediately after the ensuit Example.

Quest. 1. There was an old Man whose Age was required; to which he replied, I have 7 Sons, each having two Years between the Birth of each other, and in the 44th Year of my Age my eldeft Son was born, which is now the Age of the youngest. I demand, What was the old Man's Age.

Now to resolve this Question, first set down the Fathers's Age at the Birth of his first Child, which 44 was 44; then the Difference between the Oldest and 12 the Youngest, which is 12 Years, and then the Age 44 of the Youngest, which is 44; and then add them all together, and there Sum is 100, the compleat 100 Age of their Father.

Quest. 2. A Man lent his Friend at several Times, these as everal Sums, viz. at one Time 63 1. at another Time hat so 1. at another Time 48 1. at another Time 156 1. Now

defire to know how much was lent him in all? I no

Set the Sums lent one under another, as you fee in 52 oe ed for the Margent, and then add them together, and you 50 ove will find their Sum to amount to 317 1. which is the wes Total of all the several Sums lent, and so much is 48 156 th due to the Creditor.

317 Quest. 3. There are two Numbers, the least whereof is 40, and their Difference 14. I defire to 04 know what is the greater Number, and also 40 what is the Sum of them both? First set 14 09 down the least, vie. 40 and 14, the Difference, and add them together, and their Sum is 54 greatest 54 for the greatest Number; then I set 40 (the least 40 least) under 54 (the greatest) and add them together, and their Sum is 94, equal to the Sum 94

greatest and least Numbers. 01

DAVO mof

CHAP. V.

Of Subtraction of whole Numbers.

and OUbtraction, is taking of a leffer Number out of a great and ter ef a like Kind, whereby to find out a Third Num to the ber, being or declaring the Inequality, Excess, or Diffe for t rence between the Numbers given ; or Subtraction is that the by which one Number is taken out of another Number Subt given, to the End that the Residue or Remainder may be give known, which Remainder is also called the Reft, Re dispe mainder, or Difference of the Numbers given. fee in

2. The Number out of which Subtraction is to be made, not, must be greater, or at least equal with the other Number rema given; the higher Number is called the Major, and the then lower, Minor; and the Operation of Subtraction being I bor finished, the Rest or Remainder is called the Difference of from the Numbers given. wife

3. In Subtracti n, place the Numbers given respective and s ly, the one under the other, in such Sort as like Degrees, there Places, or Denominations may stand in the same Series, there viz. Units under Units, Tens under Tens, Pounds under und t Pounds, Ge. Feet under Feet, and Parts under Parts, Ge. ar This being done, draw a Line undermeath, as in Addition nete

4. Having placed the Numbers given as is before diquali rected, and draw a Line under them, subtract the lower 136 Number (which in this Cafe must always be less than the beie Uppermost) out of the higher Number, and subscribe the Difference or Remainder respectively below the Line, and when the Work is finished, the Number below the Line, will give you the Remainder.

As for Example, Let 364521 be given to be subtracted from 795836, I fet the leffer under the greater as in the 6. Margent, and draw a Line under them; then beginning at the right Hand, I fay, one out of 6, and there remains 5, which I fet in order under the Line; then I proceed to the next, faying, 2 from 3 refts 1, which I note also under the Line; and thus I go on till I have finished the

795836 me in Tthe

431315 ffer:

Work:

Work; and then I find the Remainder or Difference to be

5. But if it so happen (as commonly it doth) that the lowermost Number or Figure is greater than the uppermost, then in this Case add ten to the uppermost Number, and fubtract the faid lowermost Number from their Sum, real and the Remainder place under the Line, and when you go un to the next Figure below, pay an Unit by adding it thereto. iffe for the Ten you borrowed before, and fubtract that from that the higher Number of Figures, and thus go on till your aber Subtraction be finished. As for Example, Let 437503 be be given, from whence it is required to subtract 153827, I Re dispose of the Numbers as is before directed, and as you fee in the Margent; then I begin, faying, 7 from 3 I can-

ade not, but (adding to thereto) I fay, 7 from 13 and there

iber remains 6, which I fet under the Line in order ;

the then I proceed to the next Figure, faying, I that eing I borrowed and 2 is 3 from O I cannot, but 3 153527 e of from 10 and there remains 7, which I likewie fet down as before; then I that I borrowed

ive and 8 is 9, from 5 I cannot, but 9 from 15, and rees there remain 6; then I I borrowed and 3 is 4 from 7, and ries, there remain 3; then 5 from 3 I cannot, but 5 from 13, oder and there remain 8; then I borrowed and I are 2, from tion mele Numbers are lubtracted one from another, the Incdismality, Remainder, Excess, or Difference, is found to be ower 1676. Examples for thy farther Experience may be

8. When your Subtraction is ended, if you defire to eve the Work, whether it be true or no; then add the mainder to the minor Number, and if the Aggregate or lie two be equal to the major Number, then is your Oration true, otherwise false: Thus let us prove the first tample of the fifth Rule of this Chapter, where after btraction is ended, the Numbers sland as in the Margent,

Now to prove the Work, I add the faid Re-43750 don mainder 283976 to the minor Number 153827, 1538: 8 by the fourth Rule of the foregoing Chapter, 2836 mais and I find the Sum or Aggregate to be 437503, equal to the major Number, or Number from whence the leffer is fubtracted. Behold the 43750 8 Work in the Margent. The Proof of another Example, may be of the first Ente ample of the 6th Rule of this Chapter, where it is requested to subtract 57 1. 16 s. 3 d. 2 grs. from 375 1. 13 s. 7 to qr. and by the Rule I find the Remainder to be 317 low 17 s. 03 d. 3 grs. Now to prove it, I add the faid Remainder 317 1. 17 s. d. g ber 1 1. 03 d. 3 grs. to the minor Number 375 13 07 5; 1. 16 s. 03 d. 2 grs, and their 16 57 03 Sum is 375 l. 13 s. 7 d. 1 gr. equal to the major Number, which proves 317 03 the Work to be true; but if it had 375 happened to have been either more 13 07 or less than the said major Number, then the Operation had been falle.

Subtraction of

the Remainder or Difference being 283676.

9. The general Effect of Subtraction, is, to find Difference or Excess between two Numbers, and the R when a Payment is made in Part of a greater Sum, thence Date of Books printed, the Age of any Thing, by know 10: ing the prefent Year, and the Year wherein they are matrk.

created, or built, and fuch like.

The Questions appropriated to this Rule, are such

Quest. What Difference is there between one Thing

125 Foot long, and another of 66 Foot long?

To resolve this Question, I first set down the major or greater Number 125, and under it the mipor or leffer Number 66, as is directed in the third Rule of this Chapter, and according to the fourth Rule of the same, I subtract the Minor from the Major, and the Remainder, Excess, or Difference I find to be 19. See the Work in the Margent.

Quest. 2. A Gentleman hath owed a Merchant 36 whereof be hath paid 278 1. What more doth he owe! 03

03

fuch

hing

C

1-

d

h

ic

ce

t 369

owe

To give an Answer to this Question, I first fet 750 down the major Number 365 1. and under it I place 365 38 28 the minor, and subtract the one from the other, 278 hereby I discover the Excess, Difference, or Re367 mainder, to be 87; and so much is still due to the 87
reditor, as per Margent.

Quest. 3. An Obligation was written, a Book prir ted,

Child born, a Church built, or any other Thing made in

At Line Year of our Lord 1572, and now we acrequestion the Year of our Lord 1687, the Question 1687 to know the Age of the said Things; that is, 1572

31 How many Years are paffed fince the faid Things were made? I fay, if you subtract the lesser Num-

d. of er 1572, from the greater 1687, the Remainder

07 will be 115, and fo many Years are passed fince the Maing of the faid Things; as by this Work in the Marent.

Queft. 4. There are three Towns lie in a straight Line, Of meen the farthest of these Towns, viz. London and Tork, 151 Miles, and from London to Huntingdon is 49 Miles.

nd the Remand how far it is from Huntingdon to Trk?

To resolve this Question, subtract 49 the Distance 151 the Retween London and Huntingdon, from 151, the Dim, the nee between London and Tork, and the Remainder know 102, for the trueDistance between Huntingdon and 102.

CHAP. VI.

Of Multiplication of Whole Numbers.

MUltiplication is performed by two Numbers of like Kind, for the Production of a Third, which all have fuch Reason to the one, as the other hath to the nit, and in Effect is a most brief and artificial Compound ddition, of many equal Numbers of like Kind into one um. Or, Multiplication is that by which we multiply to or more Numbers, the one into the other, to the nd that their Product may come forth, or be discored.

C 4

Or, Multiplication is the Increasing of any one Number by any other, to often as there are Units in that Number by which the other is increased; or by having two Num bers given to find a Third, which shall contain one of the Numbers as many times as there are Units in the other.

2. Multiplication hath three Parts. First, The Multi plicand or Number to be multiplied. Secondly, The Multiplier or Number given by which the Multiplicand is tob multiplied. And thirdly, The Product or Number produced by the other two, the one being multiplied by the other; as if 8 were given to be multiplied by 4, I fay 4 times 8 is 32; here 8 is the Multiplicand, and 4 is the Multiplier, and 32 is the I'ro- 31 duct.

3. Multiplication is either Single, by one Figure ; of

Compound, that confilts of many.

Single Multiplication is faid to confit of one Figure, by cause the Multiplicand and Multiplier confill each of the of a Digit, and no more; fo that the greatest Product the can arife by Single Multiplication is 81, being the Squar of 9; and C mound Multiplication is faid to confift of my my Figures, because the Multiplicand or Multiplier confil of more Places than one; as if I were to multiply 4364 6: It is called Compound, because the Multiplicand 41 is of more Places than one, viz. 3 Places.

4. The Learner ought to have all the Varieties of Si gle Multiplication by Heart, before he can well proces any farther into this Art, it being of most excellent Ul and none of the following Rules in Arithmetick, but wh have a principal Dependance thereupon, which may be om

learne by the following Table.

5	10	15	20	25	30	3.5	40	45
6	12	18	24	30	36	42	48	54
7	14	21	28	35	42	49	36	63
8	16	24	32	40	48	56	64	72
9	18	27	36	45	54	63	72	84

The Use of the precedent Table is this: In the upper oft Line or Column you have expressed all the Digits from to 9; and likewife beginning at 1, and going downwards the fide Column, you have the fame ; fo that if you ould know the Product of any two fingle Numbers mulplied by one another, look for one of them (which you ease) in the uppermost Column, and for the other in the de Column, and running your Eye from each Figure ang the respective Columns in the common Angle (or ace) where these two Columns meet, there is the Proat required. As for Example, I would know how uch is 8 times 7; First I look for 8 in the uppermolt olumn, and 7 in the fide Column; then do I cast my ye from 8 along the Column downwards from the lame, d likewise from 7 in the side Column, I cast my Eye om thence toward the right Hand, and find it to meet ith the first Column at 56, so that I conclude 56 to be e Product required, Oc.

5. In Compound Multiplication, if the Multiplicand conles of many Places, and the Multiplier of but one gure; first set down the Multiplicand, and under it ace the Multiplier in the Place of Units, and draw a Line iderneach them; begin then, and multiply the Multiplier to every particular Figure of the Multiplicand, beginning the Place of Units, and so proceed towards the Lete and, setting each particular Product under the Line, in der as you proceed; But if any of the Products ex-

G 5 ..

ceed

geeds 10, or any Number of Tens, fet down the Excess and for every 10 earry an Unit to be added to the next Pn duct, always remembring to fet down the total Product the last Figure; which Work being finished, the Sum Number placed under the Line shall be the true and ton Product required. As for Example, I would multip 478 by 6: First set down 478, and underneath it 6, in the Place of Units, and draw a Line underneath them, as in the Margent; then I begin, faying, 6 times 8 is 48, which is 8 above four Tens, therefore I set down 8 47 (the Excess) and bear 4 In Mind for the 4 Tens; then I proceed, faying, 6 times 7 is 42, and . that I carried is 46, I then let down 6 and carry 4, 286 and go on, saying, 6 times 4 is 24, and 4 that I carried is 28, and because it is the last Figure, I set it down, and so the Work is finished, and the Product found to be 2868, as was required.

6. When in Compound Multiplication, the Multipli confisteth of diverse Places, then begin with the Figu in the Place of Units in the Multiplier, and multiply it in all the Figures in the Multiplicand, placing the Produ below the Line, as was directed in the last Example; th begin with the Figure of the second Place of the Multip er, viz. the Place of Tens, and multiply it likewise it she whole Multiplicand, (as you did the first Figure) tog cing its Product under the Product of the first Figure; in the same Manner by the Third, Fourth, and Fifth, until you have multiplied all the Figures of the Multipli mul particularly into the whole Multiplicand, still placing Mu Product of each particular Figure under the Product mul its precedent Figure; herein observing the follow whi

Caution.

In the placing of the Product of each par- A Caut ceed ticular Figure of the Multiplier, you are not to follow the 2d Rule of the 4th Chapter, viz. to p Prod Units under Units, and Tens under Tens, &c. but bed place the Figure or Cypher in the Place of Units then Tens in the Line above it, and the Figure or Cyphe and the Place of Units in the third Line under the Place place. Kens in the fecond Line, Co. observing this Order, Line

you have finished the Work, still placing the first Figure of every Line or Product under the fecond Figure or Place of Tens in that which was above it, and having fo done, draw a Line under all these particular Products, and add them together; so shall the Sum of all these Products be the total Product required.

As if it were required to multiply 764 by 27, I fet them down the one under the other, with a Line drawn underneath them; then I begin, faying, 7 times 4 is 28, then

I fet down 8 and carry 2; then I fay, 7 times 6 is 42, and 2 that I carried is 44, that is 4 and go 4; then 7 times 7 is 49, and 4 that I carry is 53, which I fet down, because I have not ano-

ther Figure to multiply; thus I have done with 5348 1528 the 7, then I begin with the 2, faying 2 times 4 is 8, which I set down under (4) the second Fi-

gure or Place of Tens in the Line above it, as you may see in the Margent; then I proceed, saying,

times 6 is 12, that is 2 and carry 1, then 2 times 7 is 14, and I that I carry is 15, which I fet down, because it is the Product of the last Figure; so that the Product of 764 by 7 is 5348, and by 2 is 1528, which being placed the one under the other, as before directed, as you fee in the Margent, and a Line drawn under them, and they added together respectively, make 20628, the true Product re-

quired, being equal to 27 times 764. Another Example may be this; Let it be required to multiply 5486 by 465, I dispose of the Multiplicand and

Multiplier according to the Rule, and begin luck multiplying the first Figure of the Multiplier, llow which is (5) into the whole Multiplicand, and find the Product is 27430; then I pro-Cauth ceed, and multiply the second Figure (6) of the Multiplier into the Multiplicand, and find the

to p Product to amount to 32916, which is subscribut bed under the other Product respectively; Units then do I multiply the third and last Figure

Place (4) of the Multiplier into the Multiplicand,

yphe and the Product is 21944, which is likewise
Place placed under the second Line respectively; then I draw a
rder, Line under the said Products being placed the one under

Compendium in Multiplication.

7. Although the former Rules are fufficient for all Cafes in Multiplication, yet because in the Work of Multiplication many times great Labour may be faved, I shall acquaint the Learner with some Compendiums in order thereto, viz. If the Multiplicand or Multiplier, or both of them, end with Cyphers then in your multiplying you may neglect the Cyphers, and multiply

only the fignificant Figures, and to the Product of the fignificant Figures, add fo many Cyphers as the Number given to be multiplied did end with; that is, annex them on the right Hand of the faid Product, fo shall that give you the true Product required. As if I were to multiply 32000 by 4300, I fet them down in order to be multiplied, as you fee in the Margent; but neglecting the Cyphers in both Num-

bers, I only multiply 32 by 43, and the Product I find to be 1376, to which I anhas the 5 Cyphers in the Multiplicand and Multiplic

Si numeris prepositis u nus vel uterque adjunttes be beat ad dextram circulos, r miffis circulis fat ipforum numerorum multiplicatio, fatto demum tot insuper in tegrorum loci accenseantu quot funt omifi circuli i utrique factore. Clavis Mal Exa

8. If in the Multiplier, Cyphers are placed between Sgnificant Figures, then multiply only by the fignificant Figures neglecting the Cyphers; but here special Notice is to be taken of the true placing of the first Fi-

Si intermedio multiplicantis loco circulus fuerit, ille negligitur. Alsted. c. 6. De Arithm ...

gure after the Neglect of fuch Cypher or Cyphers ; and therefore you must observe in what Place of the Multiplier the Figure you multiply by standeth, and set the first Figure of that Product under the same

Place of the Product of the first Figure of your Multiplier: As for Example, Let t be required to multiply 371568 by 20007. Fird I multiply the Multiplicand by 7, and the Product is 2600976; then she beglecting the Cyphers, I multiply by 4,

and that Product is 1486272; now I con-

371568 40007

2600976 1486272:

14865320969

ider, that 4 is the 5th Figure in the Multiplier, therefore I place 2 (the first Figure of the Product by 4) under the fitch Place of the first Produce. by 7; and the rest in order, and having added them together, the total Product is found to be 14865320976. Other

Mal Examples in this Rule, are these following.

327586 6030 9827580 7864371 20604

31457484 47186226 15725742

975343516

1965516

162037500084

9. If you are to multiply any Number by an Unit with Cyphers, as by 10, 100, 1000, Uc. then annex fo many Cyphers before the Multiplicand, and that Number when he Cyphers are annex'd, is the Product required. As if on would multiply 428 by 100, annex 2 Cyphers to 428, and it is 42800. If it were required to multiply 102, by 10000,

Truth, all other Ways are falle, (according to Frifius) and therefore it will be necessary in the first Place to learn Di vision, and by that to prove Multiplication. There are some other Way used indeed, but on a strict Examen there is not one in a Thousand of their Products right; therefore we omit them.

11. The general Effect of Multiplication is contained in the Definition of the same, which is to find out a third Number, fo often containing one of the two given Num

bers, as the other containeth Units.

The fecond Effect is, by having the Length and Breadth of any Thing (as a Parallelogram or long Plain) to find the superficial Content of the same, and by having the su perficial Content of the Base, and the Length, to find ou the Solidity of any Parallelopipedon, Cylinder, or other folid Figures.

The third Effect is, by the Contents, Price, Value Buying, Selling, Expence, Wages, Exchange, Simple Inte reft, Gain or Loss of any one Thing, be it Money, Men chandize, Cc. to find out the Value, Price, Expence, Buy ing, Selling, Exchange, or Interest, of any Number

Things of the like Name, Nature, and Kind.

The fourth Effect (is not much unlike the other) by the Contents, Value, or Price of any one Part of any Thin denominated, to find the Contents, Value, or Price of the whole Thing, all the Parts into which the whole is divide ed, multiplying the Price of one of those Parts.

The fifth Effect is, to aid, to compound, and to make other Rules, as chiefly, the Rule of Proportion, called the Golden Rule, or Rule of Three; also by it, Things of on 1.

Denomination are reduced to another.

If you multiply any Number of Integers, or the Prin or t of the Integer, the Product will discover the Price of the Quantity, or Number of Integers given.

In a Rectangular Solid, if you multiply the Breadth the Base by the Depth, and that Produce by the Lengt the last Product will discover the Solidity or Content the fame Solid,

Some Questions proper to this Rule, may be these following: Quest. 1. What is the Content of a square Piece of Ground, whose Length is 28 Perches, and Breadth 12?

Answer, 364 square Perches; for multiplying 28 the

Length, by 13 the Breadth, the Product is fo much.

Queft. 2. There is a square Battle, whose Flank is 47 Men, and the Files 19 deep, what Number of Men doth that Battle contain? Facit. 893; for multiplying 46 by 19. the Product is 893.

Quest. 3. If any one Thing coft & Shillings, what shall 9 Things colt? Anfw. 36 Shillings; for multiplying 4 by

9, the Product is 36.

Quest. 4. If a Piece of Money or Merchandize be worth or coft 17 Shillings, what shall 19 fuch Pieces of Money or Merchandize coft? Facit. 323 Shillings, which is equal to 16 1. 35.

Quest. 5. If a Soldier or Servant get or spend 14 s. per Month, what is the Wages or Charges of 49 Soldiers or Servants for the same Time? Multiply 49 by 14, the Pro-

duct is 686 s. or 141. 6s. for the Answer.

Queft. 6. If in a Day there are 24 Hours, how many Hours are there in a Year, accounting 365 Days to constitute the Year? Facit. 8760 Hours; to which if you add the 6 Hours over and above 365 Days, as there is in a Year, then it will be 8766 Hours; now if you multiply this 8766 by 60, the Number of Minutes in an Hour, it by the will produce 525960, the Number of Minutes in a Year,

CHAP. VII.

Division of whole Numbers.

ber or Quantity given, into any Part assigned, e Prisor to find how often one Number is contained in another; or from any two Numbers given, to find a third that shall ofth confift of fo many Units, as the one of those two Numbers given is comprehended or contained in the other.

2. Division hath three Parts of Numbers remarkable, viq. First, The Dividend; 2dly, The Divisior;

not

1.

The Quotient. The Dividend is the Number given to be parted or divided. The Divitor is the Number given by which the Dividend is divided, or it is the Number which sheweth how many Parts the Dividend is to be divided in-And the Quotient is the Number produced by the Division of the two given Numbers the one by the other.

So 12 being given to be divided by 3, or into three equal Parts, the Quotient will be 4; for 3 is containing in 12 four times, where 12 is the Dividend, and 3 is the Divifor,

and 4 is the Quotient.

3. In Division set down your Dividend, and drawa crooked Line at each End of it, and before the Line at the left Hand place the Divisor, and behind that on the right Hand place the Figures of the Quotient, as in the Margent, where it is required to divide 12 3) 12 (4) by 3; First, I set down 12 the Dividend, and on each Side of it, do I draw a crooked Line, and before that on the left Hand do I place 3 the Divisor; then do I feek how often 3 is contained in 12; and because I find it four times, I put 4 behind the crooked Line, on the right Hand of the Dividend, denoting the Quotient.

4. But if, when the Divisor is a single Figure, the Dividend confisteth of two or more Places, then having placed them for the Work (as before directed) put a Point under the first Figure of the left Hand of the Dividend, provided it be bigger than (or equal to) the Divilor, but if it be lefter than the Divisor, then put a Point under the fecond Figure from the left Hand of the Dividend; which in the Figures, as far as the Point goeth from the left Hand, are the to be reckoned by themselves, as if they had no Dependance which upon the other Part of the Dividend: And for Diffinction, and fake may be called the Dividual; then ask how often the main Divifor is contained in the Dividual; placing the Answer Line in the Quotient; then multiply the Divisor by the Figure that you placed in the Quotient, and fet the Product there figu of under your Dividual; then draw a Line under the Program duct, and subtract the said Product from the Dividual main placing the Remainder under the faid Line; then put a tual, Point under the next Figure in the Dividend on the right line Hand of that to which you put the Point before, and hore draw Bent,

18

36

draw it down, placing it on the right Hand of the Remainder which you found by Subtraction; which Remainder with the faid Figure annexed before it, shall be a new Dividual; then fee again how often the Divifor is contained in this new Dividual, and put the Answer in the Quotient on the right Hand of the Figure which you put there before; then multiply the Divilor by the last Figure that you put in the Quotient, and subscribe the Product under the Dividual, and make Subtraction, and to the Remainder draw down the next Figure from the grand Dividend, (having first put a Point under it) and put it on the Right Hand of the Remainder for a new Dividual as before, and proceed thus till the Work is finished.

Observing this general Rule in all Kinds of Division. First, to feek how often the Divisor is contained in the Dividual; then (having put the Antiver in the Quotient) multiply the Divisor thereby, and subtract the Product from the Dividual. An Example or two will make the Rule plain. Let it be required to divide 2184 by 6. dispose of the Numbers given as is before directed, and as

you fee in the Margent; in order to the

Nork, then because 6 the Divisor is more 6) 2184 (3 ced than 2 the first Figure of the Dividend, I un out a Point under 1 the fecond Figure,

pro which makes the 21 for the Dividual, then do I ask how if often 6 the Divisor is contained in 21, and because I can-

the not have it more than 3 times, I put 3 nich in the Quotient, and thereby do I multiply

are the Divisor (6) and the Product is 18, ance which I fet in order under the Dividual, rion and fubtract it therefrom, and the Re-

the mainder (3) I place in order under the liver Line as you fee in the Margent.

gue Then do I make a Point under the next iere ligure of the Dividend, being 8, and 1'ro draw it down, placing it before the Re-dual mainder 3, so have 138 for a new Diviout a dual, then de I feek how often 6 is conright ained in 3S, and because I can't have it

and more than 6 Times, I put 6 in the Quo-Pro-

the

1111

tier

end

mai

of

any

or

Product (36) I put under the Dividual (38) and inbtract it therefrom, and the Remainder 2 I put under the Line,

as you see in the Margent.

Then 1 do put a l'oint under the next (and last) Figure
of the Dividend (being 4) and draw it down to the Remainder 2, and putting it on the right Hand thereof, it

mainder 2, and putting it on the right Hand thereof, it maketh 24 for a new Dividual; then I ask how often 6 is contained in 24, and 6) 2184 (304 the Answer is 4, which I put in the Quotient, and multiply the Divisor (6) 18 thereby, and the Product (24) I put under the Dividual (24) and subtract it 38 therefrom, and the Remainder is (0); 36 and thus the Work is finished, and I find the Quotient to be 364, that is 6 is con-24 tained in 2184, just 364 times, or 2184 24

Again, If it were required to divide 2646 by 7, or in to 7 equal Parts, the Quotient will be found to be 378, a by the following Operation appeareth.

being divided into 6 equal Parts, 364

7) 2646 (378

2	I	
	54 49	
	56 56	
	00	

So if it be required to divide 949 by 8, the Quotien will be found to be 118, and 2 remaining after Division is ended. The Work followeth:

end nd ad

ure e-

64

(c

r in

, 2

rtien vilia Many times the Dividend cannot exactly be divided by the Divisor, but something will remain, as in the last Example, where 946 was given to be divided by 6, the Quotient was 118, and there remained 2 after the Division was ended: Now what is to be done in this Case with the Remainder, the Learner shall be taught when we come to treat of the Reducing (or Reduction) of Fractions.

(2)

And here note, That if after your Division is ended, any Thing do remain, it must be lesser than your Divisor; for otherwise your Work is not rightly performed.

8) 73464 (9183 9) 13758 (1528

72	9
14 8	47 45
66 64	25 18
24 24	78
(0)	A (6)

then chuse so many Figures from the lest Side of the Dividend for a Dividual as there are Figures in the Dividual and put a Point under the farthest Figure of that Dividual

48 th

And it it to happen, that after you have chosen your first Dividual, (as it is before directed) you find it to be lesfer than the Divisor, then put a Point under the Figure more near to the right Hand, and feek how often the first ligure on the left Side of the Divisor is contained in the two full Figures on the left Side of the Dividual, and place the Am fwer in the Quotient, by which multiply the Divitor, and place the Product thereof in order under the Dividual, and

lubtract it therefrom, and proceed as before.

44

Always remembering that in all Cases of Division, it after you have multiplied your Divisor by the Figure find placed in the Quotient, the Product be greater than the Dividual, then you must cancel that Figure in the Quotient. and inflead thereof put a Figure leffer by an Unit (or On) and multiply the Divisor thereby, and if still the Product be greater than the Dividual, make the Figure in the Qua tient yet leffer by an Unit, and thus do until your Product be leffer than the Dividual, or at the most equal thereto, and then make Subtraction, Uc.

So if you would divide 9464 by 24, the Quotient will be found to be 394; I first put down the given Numbers is before directed in the 3d Rule. Now because my Di

vifor confideth of two Figures, I therefore put a Point under the second Figure from the left Hand of my Dividend, which there is 4r wherefore I feek how often 2 the firm Figure (on the left Side of the Divisor) is contained in 9 (the like first in the Dividual) the Antiver 15.4. which I put in the Quetient, and thereby mulciply all the Divitor, and find the I'roduct to be 96, which is greater

Divisor 385, and the Product is \$540, which is leffer than the Dividual, and therefore I put 4 in the Quotient, and subtract the faid Product from the Dividual,

and there remain 163; and thus the Work is finished; and find that 1183653 being divided by 385, or into 385 equal Shares or Farts, the Quotient, (or one of those Parts) is 3074, and besides there is 163 remaining.

And thus the Learner being well versed in the Method of the foregoing Examples, he may be fufficiently qualified for the dividing of any greater Sum or Number into as many Parts as he pleafeth; that is, he may understand the Method of dividing by a Divisor, which confisteth of 4, or 5, or 6, or any greater Number of Places, the Method being the same with the foregoing Example in every

Respect.

Remain (15556)

So if you divide 47386473 by 58736, you will for the Quotient to be 866, and 45257 will remain after Work is ended.

589122

In like manner, If you would divide 3846739244 483064, the Quotient will be 7963, and the Remains after Division will be 160572.

Compendium in Division.

1. IF any given Number be to be divided by anoth Number that hath Cyphers annexed on the right Side thereof, (omitting the Cyphers) you may cut of

ny Figures from the right Hand of the Dividend, as are are Cyphers before the Divifer, and let the remain-Numbers in the Dividend, be divided by the remain-Number, or Numbers of the Divisor, observing this hat if after your Division is ended, any Thing main, you are to annex thereto the Number or Numbers were cut off from the Dividend; and fuch new found umber shall be the Remainder. (See Mr. Oughtred's devis Mathematica, cap. 5. 3.) As for Example, Let it

required to divide 46658 by now because there are two Syphers before the Divisor, I cut as many Figures from before he Dividend, viz. 58, to that then here will remain only 466 to be divided by 4, and the Quotient be 116, and there will reman 2, to which I annex the We Figures (58) which were cut From the Dividend, and it makes

158 from the true Remainder; fo

400) 466 58 (116 26 24 (258)

but I conclude 46658 being diand by 400, the Quotient will be 116, and 258 remin after the Work is ended; as by the Work in the

Margent.

it of Remainder, Co.

nu

And hence it followeth, that if the Divisor be 1, or Duit with Cyphers annexed, you may cut off fo many foures from before the Dividend, as there are Cyphers the Divitor, and then the Figure or Figures that are on left Hand will be the Quotient, and those that are on ill hard. (Vid. Gem. Frif. Arith, Par. 1.) As thus; if 45783 ftertere to be divided by 10, I cut off the last Figure (3) with Dith thus, 4578 3, and the Work is done, and the Quo-2 4 em is 1578 (the Number on the left Hand of the Dath) naind the Remainder is 3 (on the right Hand.) In like manthe fame Number 4578; were to be divided by 100. sit off two Figures from the End thus, (457,83) and Quotient is 457, and the Remainder is 83. And if I anoth o sivide the same Figures, by 1000, I cut off 3 from he rig and thus (45 783) and the Quotient is 45, and 783 is

Definition of the fame, that is by having two unequal Nu bers, to find a third Number in fuch Proportion to the l vidend, as the Divifor hath to Unit or 1: It also discover what Region or Proportion there is between Numbers: if you divide 12 by 4, it quotes 3, which shows the Re fon or Proportion of 4 to 12 is triple.

The fecond Effect is, by the superficial Measure or Co tent, and the Length of any Oblong, Rectangular, Parallel gram, or iquare Plane known, to find out the Bread thereby; or contrarywife, by having the Superficies at breadth of the laid Figure, to find out the Length there Also by having the Solidity and Length of a Solid, to he out

the Superficies of the Bale, & contra.

The third Effect is, by the Contents, Reason, Price, V lue, Buying, Selling, Expences, Wages, Exchange, Interes Profit, or Lois of any Number of Things, (be it Mone Merchandize, or what elfe) to find out the Contents, Re fon, Price, Value, Buying, Selling, Expence, Wags Exchange, Interest, Profit, of Loss, or any one Thing the like Kind.

The fourth Effect is, to aid, to compose, and to ma other Rules, but principally the Rule of Proportion, call the Golden Rule, or Rule of Three, and the Reduction Monies, Weights, and Measures of one Denomination into another, by it also Fractions are abbreviated, by fine ing a common Measurer unto the Numerator and Dea minator, thereby discovering commensurable Numbers.

If you divide the Value of any certain Quantity by fame Quantity, the Quotient discovers the Rate or Valle of the Integer, as if 8 Yards of Cloth coft 29 Shillings Kum! you divide (96) the Value or Price of the given Quantity of the by (8) the fame Quantity, the Quotient will be to which is the Price or Value of 1 of those Yards, Vc.

If you divide the Value or Price of any unknown Qua rity, by the Value of the Integer, it gives you in the Qu tient that unknown Quantity, whose I rice is thus divide as it 12 Shillings were the Value of a Yard, I would kno how many Yards, are worth 96 Shillings: Here if you vide (69), the Price or Value of the unknown Quantity, 12, the Rate of the Integer, or I Yard, the Quotient will a, which is the Number of Yards worth 96 s.

otis

by the Divisor; and if any Thing remain after Division is ended, add it to the Product, which Product (if your Sum was rightly divided) will be equal to the Dividend. And contrariwise, if you would prove a Sum in Multiplication, divide the Product by the Multiplier, and if the Work was rightly performed, the Quotient will be equal to the Multiplicand. See the Example, where the Work is done and undone. Let 7654 be given to be multiplied by 3242, the Product will be 24814268, as by the Work appeareth.

24814263

And then if you divide the said Product 24814268 by 3242 the Multiplier, the Quotient will be 7654, equal to the given Multiplicand.

3242) 24814268 (7554

In like Manner (to prove a Sum or Number in Division) if 24814268 were divided by 3242, the Quotient will be found to be 7654; then for Proof, if you multiply 7654 the Quotient, by 3242 the Divisor, the Product will amount to 24814268, equal to the Dividend.

Or, you may prove the last, or any other Example in Multiplication, thus, viz. Divide the Product by the Multiplicand, and the Quotient will be equal to the Multiplier.

See the Work.

D 3

7654

45	Division of 7654 3232	Chap.

-	-	-

From whence there arises this Corollary, that any Operroveration in Division, may be proved by Division; for if a Division in Division is ended, you divide the Dividend by the the Quotient, the new Quotient thence arising will be equilibre to the Division of the first Operation; for Tryal whereof by let the last Example be again repeated.

(0)

3242) 24814268 (7654

(0)

No

ivifi

Bi ble For Proof whereof divide again 248 14268 by the Quotent 7654, and the Quotient hence will be equal to the Division 3244. See the Work:

But in proving Division by Division, the Learner is to observe this following Caucion: That if after his Division hended, there be any Remainder, before you go about to Ope prove your Work, subtract the Remainder out of your if a dividend, and then work, as in the following Example, by the here it is required to divide 43876 by 765, the Quotient equations is 57, and the Remainder is 271. See the Work following.

765) 43876 (57 3825 5622 5355 (271)

Now to prove this Work, subtract the Remainder 271 out of the Dividend 43876, and there remaineth 43605, for a new Dividend to be divided by the former Quotient 17, and the Quotient thence arising is 765, equal to the given Divisor, which proveth the Operation to be right.

Thus have we gone through the four Species of Arithmetick, viz. Addition, Subtraction, Multiplication, and Division, upon which all the following Rules, and all other Operations whatsoever that are possible to be wrought by Numbers, have their immediate Dependance, and by them are resolved. (Vide Gem. Fris. Arith. Part 1.) Therefore the Learner make a farther Step in this Art, let him be well acquainted with what has been delivered in the stregoing Chapter.

CHAP. VIII.

of Reduction.

Reduction is that which brings together two or more Numbers of different Denominations into one Denomination, [Hall's Arith. c. 13. p. 152.] or ferveth to change or alter Numbers, Money, Weight, Merfure of Time; from one Denomination to another; and likewife to abridge Fractions to the lowest Terms. All which it doth so precisely, that the first Proportion remains eth without the least Job of Error or Wrong committed; so that it belongeth as well to the Fractions as Integers of which in the proper Place. Reduction is generally performed either by Multiplication or Division; from whence we may gather. That,

2. Reduction is either Ascending or Descending.

3. Re-

3. Reduction Descending, is when it is required to reduce a Sum or Number of a greater Denomination, into a lesser; which Number, when it is so reduced, shall be equal in Value to the Number first given in the greater Denomination; [Wing. Arith 7, 2, 3, 4.] as if it were required to know how many Shillings, Pence, or Farthings, are equal in Value to 100 1. Or how many Ounces are contained in 4500 Weight. Or how many Days, Hours, or Minutes, there are in 240 Years, &c. And this Kind of Reduction is generally performed by Multiplication.

4. Reduction Ascending, is when it is required to reduce or bring a Sum or Number of a smaller Denomination into a greater, which shall be equivalent to the given Number, as suppose it were required to find out how many Pounds, Shillings, or Pence, are equal in Value to 43784 Farthings: Qr, how many Hundreds are equal to (or in) 3748 Pounds, Sc. and this Kind of Reduction is always

performed by Division.

5. When any Sum or Number is given to be reduced into another Denomination, you are to confider whether it ought to be refolved by the Rule Descending or Ascending, &c. by Multiplication or Division; if it be to be performed by Multiplication, consider how many Parts of the Denomination into which you would reduce it, are contain'd in an Unit or Integer of the given Number, and multiply the said given Number thereby, and the Product thereof will be the Answer to the Question. As if the Question were in 38 Pounds how many Shillings? Here I consider, that in I Pound are 20 Shillings, and that the 38 Number of Sillings in 38 Pounds will be 20 times 38, 20 wherefore I multiply 38 1. by 20, and the Product—is 760, and so many Shillings are contained in 38 760 Pounds, as in the Margent.

But when there is a Denomination or Denominations between the Number given and the Number required, you may (if you please) reduce it into the next inferior Denomination, and then into the next lower than that, &c, until you have brought it into the Denomination required. As for Example, Let it be demanded in 132 Pounds how many Farthings? First, I multiply 132 (the Number of Pounds given) by 20, to bring it into Shillings,

D 5

and

tted:

ers of

form

ce wa

All

6. And if the Number propounded to be reduced is to be divided, or wrought by the Rule ascending, consider how many of the given Numbers are equal to an Unit, or Integer in that Denomination to which you would reduce your given Number, and make that your Divisor, and the given Number, your Dividend; and the Quotient there arising will be the Number sought or required: As so Example, let it be required to reduce 2640 Shillings into Pounds. Here I consider that 20 Shillings are equal to 20, 2640 (13)

2640 Shillings into Pounds. Here I consider that 20 Shillings are equal to one Pound; wherefore I divide 2640 (the given Number) by 20, and the Quotient is 132, and so many Pounds are contained in 2640 Shillings. In Reduction descending and ascending, the Learner is advised to take particular Notice of the Tables delivered in the second Chapter of this Book, where he may be informed what Multipliers and Divisors to make Use of in the reducing of any Number to any other

Denomination whatsoever, especially English Mone Weights, Measures, Time, and Motion; but in this Plat is not convenient to meddle with Foreign Coins, Weight or Measures,

But if in Reduction ascending, it happen that there is Denomination or Denominations between the Number govern and the Number required, then you may reduce you Number

e 15

er g

you

Number given into the next superior Denomination, and when it is so reduced, bring it into the next above that, and so on until you have brought it into the Denomination required. As for Example, Let it be demanded in 126720 Farthings how many Pounds? First I divide my given Number, being Farthings, by 4, to bring them into Pence, (because 4 Farthings make one Penny) and there are 31680 Pence; then I divide 31680 Pence by 12, and the Quotient giveth 2640 Shillings, and then I divide 2640 Shillings by 20, and the Quotient giveth 132 Pounds, which are equal in Value to 126720 Farthings: See the whole Work as it followeth.

)	126720	12)	2 0) (264 0 (1)	7.

	6	76	6	
	4 .	72	6	
	27	48 48	4 4	
	32	(0)	(0)	

7. When the Number given to be reduced confisteth of diverse Denominations, as Pounds, Shillings, Pence, and Farthings, or of Hundreds, Quarters, Pounds, and Ounces, &c. then you are to reduce the highest (or greatest) Denomination into the next Inferior, and add thereunto the Number standing in the Denomination, which your greatest or highest Number is reduced to; then reduce that Sum into the next inferior Denomination; adding thereto the Number standing in that Denomination; do so

1. s. d. 48 13 16 20 960 Shill. Add 13 Sum 973 Shill. 12 1946 973 11675 Pence Add 10 Sum 11686

until you have brought the Number given into the Deno mination proposed. As if it were required to reduce 18 1. 24. 13 s. 10 d. into Pence; first I bring 48 l. into Shillings, facit by multiplying it by 20, and the Product is 950 Shillings; 438 b to which I add the 13 Shillings, and they make 973; the much, I multiply 973 by 12, to bring the Shillings into Pence. Qu and they make 11676 Pence, to which I add the 10 d Pence and they make 11685 Pence for the Answer. See the Number Work done.

8. If in Reduction Ascending, after Division is ended 9340 any Thing remain, fuch Remainder is of the same Deno Shilli mination with the Dividend.

Example. In 4783 Farthings, I demand how man Pounds?

First, I divide the given Number of Farthings, vi multi (4783) by 4, to bring them into Pence, and the Quotient Poun is 1195, and there remaineth 3 after the Work of Divition is ended, which is 3 Farthings.

Again, I divide 1195 Pence (the faid Quotient) by 12 to reduce them into Shillings, and the Quotient is 99 Shill lings, and there is a Remainder of 7, which is 7 Pence.

And then I divide 99 Shillings (the last Quotient) by 20, to bring it into Pounds, and the Quotient is 4 1. and there remaineth 19 Shillings; fo that I conclude that in 4783 (the proposed Number of Farthings) there is 4 Pounds, 10 Shillings, 7 Pence 3 Farthings: View the tollowing Operation;

> 20 4) 4783 (1195 (9) 4 Pounds 108 115 (19) Spillings. 108 38 rem. (7) Pence. 30

975 Facit 04 03 23 19 07 20

iply the given Number by 20, to bring it into Shillings, by and it produceth 113460 Shillings, then multiply that and Product by 12, to bring it into Pence, and it produceth tin 1361520 Pence; then lastly, multiply the Pence by 4, and it produceth 544608@ Farthings.

eno-

any

hil

the

Facit 5446080 Farthings.

Or this Question might have been thus resolved, vin multiply 5673 the given Number of the Pounds by 966 (the Number of Farthings in a Pound) and it produced the same Effect, as you may see by the Work.

5673 Pounds	20 Shillings
960	12
	-
340380	240 Pence
1057	4

Facit 5446080 Farth.

960 Farthings.

Otherwise thus: First bring the given Number 56731 into Shillings, and multiply the Shillings by 48, the Number of Farthings in a Shilling, and the same Effect is them by likewise produced, viz.

5673 Pounds	12 Pence		
113460 Shillings	48 Farthings		
907680 153840			

Fa. 5446080 Farthings

These various Ways of Operation are expressed to be form the Judgment of the Learner, with the Reason of the Rule. More ways may be shown, but these are sufficient even for the meanest Capacities.

Quest. 4. In 458 L. 16 s. 7 d. 3 qrs. how many Farthings? To resolve this Question, consider the 7th Rus of this Chapter, and work as you are there directed, and you will find the aforesaid given Number to amount to 440479 Farthings, viz.

mo

the

Pre Pla

cau 8 is

gui

Add 9160 16 Shillings

Sum 9176 Shillings

18352 9176

Add 7

Sum 110119 Pence

Add 3

Sum 440479 Farthings

This last Question, or any other of this Kind, may be more concifely resolved thus, viz. When you multiply the Pounds by 20, to bring them into Shillings, to the Product of the first Figure, add the Figure standing in the Place of Units in the Denomination of Shillings; but because the first Figure in the Multiplier is (0) I say, o times 8 is nothing, but 6 is 6, which I put down for the first Figure in the Product, then because the Multiplier is o, I go on no further with it; for if I should, the whole Product will be o, but proceed; and when I come to multiply by the second Figure in the Multiplier, to the Product of it, I add the Figure standing in the Place of Tens in the Denomination of Shillings, which is 1, faying, 2 times 8 is 16, and (the faid Figure) 1 is 17; then I fet down 7. and carry the Unit to the Product of the next Figure, as is directed in the 5th Rule of the 6th Chapter foregoing, and finish the Work. So that now you may have the whole Product

Chap

Product and Sum of Shillings at one Operation, which the same as before; and when you multiply the Shilling by 12, to bring them into Pence, (after the same Manner) add to the Product the Number standing in the Denomination of Pence, and so when you multiply the Pence by a to bring them into Farthings, add to the Product the Number standing under the Denomination of Farthings. Se the last Question thus wrought.

Facit 440479 Fartbings.

After the Method last prescribed, are all the following Examples, that are of the same Nature, wrought and refolved.

Quest. 5. In 4375866 Farthings, I demand how many

Pounds, Shillings, Pence, and Farthings ?

To resolve this Question, First, I divide the given Number of Farthings by 4, and the Quotient is 1093966 Pence, and their remaineth 2 after the Division is ended which (by the 8th Rule foregoing) is two Farthings; the I divide 1093966 Pence by 12, and the Quotient is 91165 Shillings, and there remaineth 10 after Division, which by the said 8th Rule is so many Pence, viz. 10 d. then divide 91463 Shillings by 20, and the Quotient 4558 hand there remaineth 3 Shillings; so the Work is finished and I find that in 4375866 Farthings, here are 4558 has 10 d. 2 grs. See the Operation.

Quest. 6. In 4386 1. I demand how many Groats?
To resolve this Question, I reduce the given Number of Pounds into Shillings, and they are 87720 Shillings; now I consider that in a Shilling are 3 Groats, therefore I multiply the Shillings by 3, and it produceth 263160 Groats. See the Work:

4386 Pounds

87720 Shillings

Facit 263 160 Greats.

This Question might have been otherwise resolved thus, viz. considering that in a Pound (or 20 Shillings) there are three Times 20 Groats, which makes 60, by which I multiply the Number of Pounds given, and it produceth the same Effect at one Operation, as followeth.

4386

4386 Pounds 60 Groats in 20 s.

Facit 263160 Greats 4386 1.

Quest. 7. In 43758 Three-pences, I defire to know how

many Pounds?

To resolve this, and many such like Questions: First, I divide my given Number of Three-pences by 4, because a Three-pences are in a Shilling, and the Quotient is 10939 Shillings, and there remaineth 2 after Division is ended which is two Three-pences (by the 8th Rule of this Chapter) which are equal in Value to 6 d. them I divide 10932 Shillings by 20, and the Quotient giveth 5461. and 1948 remains: So that I conclude in 43758 Pieces of Three pence per Piece, there are 5461. 195. 6 d. as by the Work appeareth:

4) 43758	20	1.	s.	d.
4	(1093)9	(540	19	00
-	10			
37 3 6	9			
15	13			
	12			
38	19	Shilling	5	
(2)	Three-pe	nce, or	6	7.

This Question might have been otherwise resolved thus viz. First multiply the given Number of Three-pence 43758, by 3 the Number of Pence in Three-pence, and the Product (viz. 131274) is the Number of Pence equal to the given Number of Three-pences, which Number of Pence may be brought into Pounds by dividing by 12, and by 20, and the Quotient you will find to be equal to the former Work, 546 1. 19 5. 6 d.

		112	9.		
		108	8		
		47	13	-	
		36	12		
		114	re.(19).	Shilling	,

Or thus, Divide the given Number of 3 Pences by the Number of 3 Pences in a Pound, or 20 Shillings (which you will find to be 80, if you multiply 20 s. by 4, the Number of 3 Pences in a Shilling) and you will find the Quote to be 546 l. as before, and a Remainder of 78 Three-pences; and if you divide those 78 Three-pences by (because there are 4 Three-pences in a Shilling, you will find the Quotient to be 19 s. and 2 Three-pences remain, which are equal to 6 d. which is the same that was refore found.

(6) Pence remains.

Quest. 8. In 4785 1. 13 s. how many Pieces of 13 d.

per Piece ?

This Question cannot be resolved by Reduction Descending or Ascending absolutely, (because 13 d. \frac{1}{2} is no ever Part of a Pound) but rather by them both jointly, viz. Multiplication and Division; but if you bring the Number given into Half-pence, and divide the Half-pence by the Half-pence in 13 d. \frac{1}{2}, viz. 27, the Quotient will be the Answer; for having brought 4785 l. 13 s. into Half-pence, I find it makes 2297112, which I divide by 27 (because there are so many Half-pence in 13 d. \frac{1}{2}) and the Quote gives 85078 Pieces of 3 d. \frac{1}{2}, and 6 Half-pence remain over and above: Observe the Work solving.

ful

First, bring your given Number of Dollars into Pence, and then your Pence into Pounds, according to the former Directions, Thus in 4 s. 4 d. (viz. a Dollar) you will find 52 Pence, by which multiply 540 Dollars, and it produceth 28080 Pence, which if you divide by 246 (the Pence in one Pound) the Quotient will give you 117 1. which are equal in Value to 540 Dollars, at 4 s. 6 d. per Dollar. 549

Rem. (18) Half-pence, or 9 d.

Quest. II. In 4386 1. I demand how many Pieces of 6 d. of 4 d. and of 2 d. of each an equal Number? That is to fay, What Number of Six-pences, Groats, and Twopences will make 4386 1. and the Number of each equal?

The Way to resolve Questions of this Nature, is to add the feveral Pieces into which the given Number is to be brought into one Sum, and reduce the given Number into the same Denomination with their Sum, and to divide the aid given Number (so reduced) by the said Sum, and the Quotient will give you the exact Number of each Piece. And after the same Method will we proceed to resolve the present Question, viz.

enny y by dua inds,

So that I conclude by the Operation, that \$7720 Sir. pences, and 37720 Groats, and 87720 Two-pences, and just as much (or equal to) 4386 1. or if you admit a 5 s. to be thus divided, it is equal to 5 Six-pences, and 5 Four-pences or Groats, and 5 Two-pences.

24 24

(0)

Another Question of the same Nature with the last, &

this following, viz.

Quest. 12. A Merchant is defirous to change 148 1. int Ving. Pieces of 13 d. 1, of 12 d. of 9 d. and 6 d. of 4 d. and h will have of each fort an equal Number of Pieces, I defined not to know the Number ? ich i

Do as you were taught in the last Question, viz. add the feveral l'ieces together, and reduce the Sum into Hall Pence, then reduce the Sum to be charged, viz. 1481 into the same Denomination, and divide the Greater b the Leffer, and in the Quotient you will find the Answer viz. 798 is the Number of each of the Pieces required and 18 remaineth, which is 18 Half-pence by the 8th Rul of this Chapter. See the Work as followeth:

72

Queft. 15. A Merchant fent to a Goldinith 16 Ingots of Silver, each containing in Weight 2 1. 4 oz. and ordered it to be made into Bowls of 2 1. 8 iz. per Bowl, and Tankards of 1 1. 6 07. per Piece, and Salts of 10 17 10 p.w. per Salt, and Spoons of 1 ig. 18 p.m. per Sp. on, and of each an equal Number; I defire to know how many of each Sort he must make?

This Question is of the same Nature with the 11th and 12th Questions foregoing, and may be answered after the fame Method, viz. First, add the Weight of the several, Veffels, into which the Si'ver is to be made, into one Sum, and reduce to one Denomination, and the make 1248 Penry weights; then reduce the Weight of the Ingot into the fame Denomination. viz. Penry weights, and it makes 560 Penny-weights, and multiply them by the Number of Ingots, viz. 16, and the Product will give you the Weight of the 16 Ingots, viz. 8960; then divide the Product by the Weight of the Veffels, viz. 1248, and the Quotient riveth you the Ansiver to the Question, viz. 7, and 224 . w. romaineth over and above.

1.

07. p.m. 21.

Facil 482 7 13 21

ight

, and and

fee

1112

Rem. (224 Penny-weights

The Proof of the Work is as followeth, viz.

p.10. 1. G. p.w. 07. Bowls of per Bowl is 18 08 CO 06 00 per Tank. is 10 06 Tank. of 00 06 ·00 per Salt, is o6 Salts of 0 10 16 16 10 (Spoons of o 01 18 per Spoon, is or 01 06 224 Penny-weight remaining 11 04 37 04 00

So that you see the Sum of the Weight of each Vessel, together with the Remainder, is 37 1. 4 17. which is equal to the Weight of the 16 Ingots delivered. For if 37 1. 4 17. be reduced to Penny-weights, it makes 8960.

And so many will reach round the World, the whole being about 21600 Miles; so that if any Person were to go round, and go 15 Miles every Day, he would go the whole Circumserence in 1440 Days; which is 3 Years, 11 Months, and 15 Days.

Reduction of Time.

Queft. 23. In 28 Years, 24 Weeks, 4 Days, 16 Hours,

Minutes, how many Minutes?

Tears	Weeks	Days	Hoters	Minute:
28	24	4	16	30
52 W	eks in a Y	car		

60

1450 Week

7

10154 Days

24

41462

20729

248752 Hours

14925 150 Minutes

Note, That in refolving the last Question after the Method expressed, there is lost in every Year 30 Hours. For the Year consistent of 365 Days and 6 Hours; but by multiplying the Years by 52 Weeks, which is 364 Days, you lose 1 Day and 6 Hours every Year; wherefore to find an exact Answer, bring the odd Weeks, Days, and Hours into Hours, and then multiply the Years by the Number of Hours in the Year, viz. 8766, and to the Froduct add the Hours contained in the odd Time, and you have the exact lime in Hours, which bring into Minutes, as before. See the last Question thus resolved:

			Weeks 24 7	Days 4	Hours,
28 8766	Days 365 24	Hours 6	172 24		
172 172	1466		694 345		
197 228		Hours in a	4144 Year.	Hours.	
249592	Hours				

14975520 Minutes in 28 Years, and 4144 Hours.

So you see that according to the Methods first used to resolve this Question, the Hours contained in the give Time are 248752, but according to the last, best, of truest Method, they are 249592, which exceeds the farmer by 840 Hours.

But for most Occasions it will be sufficient to multiple the given Years by 365, and to the Product add the Day in the odd Time, if there be any, and then there will only a Loss of fix Hours in every Year, which may be supplied by taking a fourth Part of the given Years, and adding it to the contained Days, and you have your Design

Note, That as Multiplication and Division do interchangeably prove each other, so Reduction Descending and Ascending, prove each other by inverting the Question, as the 13th and 14th, and likewise the 16th and 17th Questions foregoing by Inversion, do interchangeably prove each other. The like may be performed for the Proof of any Question in Reduction whatsoever.

CHAP. IX.

Of Comparative Arithmetick; viz. The Relation of Numbers one to another.

1. COmparative Arithmetick, is that which is wrought by Numbers, as they are confidered to have Relation one to another, and this confifts either in Quantity or in Quality. Vide Boetius's Arith. Lib. 1. cap. 21.

2. Relation of Numbers in Quantity, is the Reference or Respect that the Numbers themselves have to one another, where the Terms or Numbers propounded are always too, the first called the Antecedent, and the other the Conse-

quent. (See Wing. Arithm.)

3. The Relation of Numbers in Quantity confils in the Differences, or in the Rate or Reason that is found betwixt the Terms propounded, the Differences of two Numbers being the Remainder found by Subtraction, (according to Alfted) but the Rate or Reason betwixt two Numbers is the Quotient of the Antecedent divided by the Consequent, so 21 and 7 being given, the Difference betwixt them will be sound to be 14, but the Rate or Reason that is betwixt 21 and 7, will be found to be triple Reason, for 21 divided by 7, quotes 3, the Reason or Rate.

4. The Relation of Numbers in Quality (otherwise called Proportion) is the Reference or Respect that the Reason of Numbers have one unto another; therefore the Terms given ought to be more than two. Now the Proportion or Reason between Numbers relating ore to another, is either Arithmetical or Geometrical.

5. Arithmetical Proportion is, when diverse Numbers differ one from another by equal Reason; that is, have

equal Differences.

1

rc.

nu-

ers

So

So this Rank of Numbers, 3, 5, 7, 9, 11, 13, 15, 17,

differ by equal Reason, viz. by 2, as you may prove.

6. In a Rank of Numbers that differ by Arithmetical Proportion, the Sum of the first and last Term being multiplied by half the Number of Terms, the Product is the total Sum of all the Terms.

Or, if you multiply the Number of the Terms by the half Sum of the first and last Terms, the Product is the

total Sum of all their Terms.

So in the former Progression given, 3 and 17 is 20, which multiplied by 4, viz. Half the Number of Terms, the Product gives 80, the Sum of all the Terms; or multiply 8 (the Number of Terms by 10) half the Sum of the first and last Term, the Product gives 80 as before.

So also, 21, 18, 15, 12, 9, 6, 3, being given, the Sum of all the Terms will be found to be 84; for here the Number of Terms is 7, and the Sum of the first and last (viz. 21 and 3) is 24, half whereof, (viz. 12) multiplied by 4,

produceth 84, the Sum of the Terms fought.

7. Three Numbers that differ by Arithmetical Proportion, the Double of the Mean (or middle Number) is equal to the Sum of the Extreams.

So 9, 12, and 15, being given, the Double of the Mean 12, (viz. 24) is equal to the Sum of the two Ex-

treams 9 and 15.

8. Four Numbers that differ by Arithmetical Porportion either continued or interrupted) the Sum of the two Means

is equal to the Sum of the two Extreams.

So 9, 12, 18, 21, being given, the Sum of 12 and 18, will be equal to the Sum of 9 and 21, viz. 30; also 6, 8, 16, being given, the Sum of 8 and 14 is equal to the Sum of 6 and 16, viz. 22, See Wingate's Arith. c. 35.

9. Geometrical Proportion (by some called Geometrical Progression) is when diverse Numbers differ, according to

ight Reason.

So 1, 2, 4, 8, 16, 32, 64, Ve. differ by Double Reason; and 3, 9, 27, 81, 243, 729, differ by triple Reason; 4, 16, 44, 256, Ve. differ by quadruple Reason, Ve.

10. In any Number that increase by Geometrical Proportion, if you multiply the last Term by the Quotients any one of the Terms divided by another of the Terms which being less is next unto it, and having deducted, or subtracted the first Termout of that Product, divide the Remainder by a Number that is an Unit less than the said Quotient, the last Quote will be the Sum of all the Terms.

So 1, 2, 4, 8, 16, 32.64, being given, first I take one of the Terms, viz.

8, and divide it by the Term which is
less, and next to it (viz. by 4) and the
Quotient is 2, by which multiply the
last Term by 64, and the Produck is 128,
from whence I subtract the first Term,
(viz. 1.) the Remainder is 127, which
divided by the Quotient 2 made less by
1, viz. 1. the Quote is 127, for the Sum of all the given
Terms, as by the Work in the Margent.

Soif 4, 16, 64, 256, 1024, were given, the Suma

all the Terms will be found to be 1364.

For first, I divide 64, one of the Terms, by the next lesser Term, and the Quotient is 4, by which I multiply the last Term 1024, and it produceth 4096; from whence I subtract the first Term 4, and the Remainder is 4092, which I divide by the Quote less by 1, viz. 3 and the 3) and Quote is 1364, for the total Sum of all the Terms as per Margent.

11. Three Geometrical Proportionals given, the Squar of the Mean is equal to the Restangle, or Product of the

Extreams.

So 8, 16, 32, being given, the Square of the Mean, 16, is 256, which is equal to the Product of the Extrem 8 and 32, for 8 times 32 is equal to 256.

12. Of Four Geometrical proportionable Numbers; ven, the Product of the two Means is equal to the Pro-

duct of the two Extreams.

So 8, 16, 32, 64, being given, I fay, that the Product of the two Means, viz. 16 Times 32, which is 512, is qual to 8 times 64, the Product of the Extreams.

Chap. 10. The Single Rule, &c.

87

Also if 3, 9, 21, 63, were given, which are interrupted, Isay, 9 Times 21 is equal to 3 Times 63, which is equal to 189.

From hence ariseth that precious Gem in Arithmetick, which for the Excellency thereof is called the Golden Rule,

or Rule of Three.

CHAP. X.

The Single Rule of Three Direct.

THE Rule of Three (not undefervedly called the Golden Rule) is that by which we find out a fourth Number in Proportion unto three given Numbers, so as this fourth Number that is sought may bear the same Rate, Reason, and Proportion to the third (given) Number, as the second doth to the first, from whence it is called the Rule of Proportion.

2. Four Numbers are faid to be proportional, when the first containeth, or is contained by the second, as often as the third containeth, or is contained by the fourth. Vide

Wingate's Arith. Chap. 8. Scet. 4.

So these Numbers are said to be Proportionals, viz. 3, 6, 9, 18, for as often as the first Number is contained in the second, so often is the third contained in the sourch, viz. twice. Also, 9, 3, 15, 5, are said to be Proportionals; for as often as the first Number containeth the second, so often the third Number containeth the sourch, viz. 3 Times.

3. The Rule of Three is either Simple or Compound.

4. The Simple (or Single) Rule of Three, confifteth of 4 Numbers, that is to fay, it bath 3 Numbers given to find out a Fourth, and this is either Direct or Inverse, Vide Aiflead Math. lib. 2. c. 13.

5. The Single Rule of Three Direct, is when the Proportion of the first Ferm is to the second, as the third is to the sourth, or when it is required that the Number sought, (viz.) the sourth Number must have the same Proportion to the second, as the third hath to the first.

6. In the Rule of Three, the greatest Difficulty is to discover the Order of the 3 Terms of the Question pro-

pounded, viz. which is the first, second, and the third; which that you may understand; observe, that of the Three given Numbers, two always are of one Kind, and the other as of the same Kind, with the porportional Number that is sought; as in this Question, viz. If 4 Yards of Cloth cost 12 Shillings, what will 6 Yards cost at that Rate? Here the two Numbers of one Kind are 4 and 6, viz. they both signify so many Yards, and 12 s. is the same Kind with the Number sought, for the Price of 6 Yards is sought.

Again observe, That of the 3 given Numbers, those two that are of the same Kind, one of them must be the first. and the other the third, and that which is of the same Kind with the Number fought, must be the second Num-Ber in the Rule of Three; and that you may know which of the faid Numbers to make your first, and which your third, know this, that to one of these two Numbers, there is always affixed a Demand, and that Number upon which the Demand lieth, must always be reckoned the third Number. As in the forementioned Question, the Demand is affixed to the Number 6, for it is demanded, what 6 Yards will coft, and therefore 6 must be the third Number, and 4 (which is of the same Denomination or Kind with it) must be the first, and consequently the Number 12 must be the fecond; and then the Number being placed in the ferementioned Order, will stand as followeth viz.

yards s. yands

7. The next Thing is, to find out the fourth Number in Proportion; which that you may do, multiply the fecond Number by the third, and divide the Product thereof by the first, or (which is all one) multiply the 3d Term (or Number) by the second, and divide the Product thereof by the first. and the Quotient thence arising is the 4th Number in a direct Proportion and is the Number sought, or Answer to the Question, and is of the same Denomination that the second Number is of. As thus, Let the same Question be again repeated, viz. If 4 Yards of Cloth cost 12. Shillings, what will 6 Yards cost?

Having placed my Numbers according to the fixth Rule (of this Chapter) foregoing, I multiply (the second Number) 12, by (the third Number) 6, and the Product is 72, which Product I divide by the first Number 4, and the Quotient thence arising is 18, which is the 4th Proportional or Number sought, viz. 18 Shillings, (because the second Number is Shillings) which is the Price of 6 Yards, as was required by the Question. See the Work sollowing.

If	yds 4	3. 12 6	yds 6	. 18
		4) 72 (1	3 Shilling	gs
		4

		(0)		

of Pepper cost 28 1. how much will 16 C. cost at that

To resolve which Question, I consider that (according to the fixth Rule of this Chapter) the Terms or Numbers ought to be placed thus, viz. the Demand lying upon 16 C. it must be the third Number, and that of the same Kind with it must be the first, viz. 7 C. and 21 l. (being of the same Kind with the Number sought) must be the second Number in this Question; then I proceed according to this seventh Rule, and multiply the second Number by the third, viz. 21 by 16, and the Product is 336, which I divide by the first Number 7, and the Quotient is 48 l. which is the Value of 16 C. of Pepper at the Rate of 21 l. for 7 C. See the Work following.

8. If when you have divided the Product of the 2d and 3d Numbers by the first, any Thing remain after Division is ended, fuch Remainder may be multiplied by the Parts of the next inferior Denomination, that are equal to an Unit (or Integer) of the second Number in the Question, and the Product thereof divide by the first Number in the Question, and the Quotient is of the same Denomination with the Parts by which you multiplied the Remainder, and is Part of the 4th Number which is fought. And further more, if any Thing remain, after this last Division is ended, multiply it by the Farts of the next inferior Denomination equal to an Unit of the last Quotient, and divide the Product by the same Divisor, (viz. The first Number in the Question) and the Quote is still of the same Denomination with your Multiplier; follow this Method until you have reduced your Remainder into the lowest Denormination, Ge. An Example or two will make this Rule yery plain, which may be the following.

Quest. 3. If 13 Yards of Velvet, &c. cost 21 1. what will 27 Yards of the same cost at that Rate?

Having ordered and wrought my Numbers according to the 6th and 7th Rules of this Chapter, I find the Quotient be 43 1. and there is a Remainder of 8, so that I condude the Price of 27 Yards to be more than 43 1. and to he Intent that I may know how much more, I Work acfording to the foregoing Rule, viz. I multiply the faid Remainder 8 by 20 s. (because the second Number in the Question was Pounds) and the Product is 160, which diided by the first Number, viz. 13, it quotes 12, which re 12 Shillings; and there is yet a Remainder of 4, which Imultiply by 12 Pence (because the last Quotient was Shillings) and the Product is 48, which I divide by 13 (the first Number) and the Quotient is 3 d. and yet there maineth 9, which I multiply by 4 Farthings, and the roduct is 56, which divided by 13 again, it quotes 2 Farthings, and there is yet a Remainder of 10, which (bccause it cometh not to the Value of a Farthing) may be negeded; or rather fet after the 2 Farthings over the Divisor, with a Line between them; and then (by the 21st and 22d Definitions of the first Chapter of this Book) it will be of a Farthing, fo that I conclude, that if 13 Yards of Velvet cost 21 1. 27 Yards of the same will cost 43 1. 12. d. 215 grs. which Fraction is 10 Thirteens of a Farthing. Chap. 1

9. In the Rule of Three it many times happens, that though the first and third Numbers be of one Kind, as he Money, Weight, Measure, &c. yet they may not be of a Denomination, or perhaps they may both consist of man Denominations; in which Case you are to reduce be Numbers to one Denomination; and likewise your second Number (if it consistent at any Time of diverse Denominations) must be reduced to the least Name mentioned, a lower if you please, which being done, multiply the second and third together, and divide by the first, as is directly in the 7th Rule of this Chapter.

And note, that always the Answer to the Question is the same Denomination that your second Number is of,

is reduced to, as was hinted before.

Quest. 5. If 15 Oances of Silver be worth 31.19

what are 86 Ounces worth at that Rate?

In this Question the Numbers being ordered according to the 6th Rule of this Chapter, the first and third Numbers are Ounces, and the second Number is of diversely nominations, viz. 3 1. 15 s. which must be reduced a Shillings, and the Shillings multiplied by the third Number, and the Product divided by the first, gives youth Answer in Shillings, viz. 430 Shillings, which are reduced to 21 1. 10 s.

Quest. 17. If an Ounce of Silver be worth 5 Shillings, what is the Price of 14 Ingots, each Ingot weighing 71.

5 cq. 10 p.w. Answer 313 1. 5 s.

Quest. 18. It a Piece of Cloth cost 10 1. 16 s. 8 d. I demand how many Ells Engl. there are in the same, when the Ell at that Rate is worth 8 s. 4 d. Answer, 26 Ells English.

Quest. 19. A Factor bought & Pieces of Stuffs, which cost him in all 537 l. 12 s. at 5 s. 4 d. per Yard, I demand how many Yards there were in all, and how many Ells English were contained in a Piece of the same? Answer 2016 Yards in all, and 19 ½ Ells of English per Piece.

Quest. 20. A Draper bought 242 Yards of Broad-cloth, which cost him in all 254 1. 10 s. for 86 Yards, of which he gave after the Rate of 21 s. 4 d. per Yard. I demand how much he gave per Yard for the Remainder? Answer

20 s. 9 d. 64 per Yard.

Quest. 21. A factor bought a certain Quantity of Serge and Shalloon, which together cost him 126 1. 14 s. 10d. The Quantity of Serge he bought was 48 Yards, at 4s. 4 d. per Yard; and for every two Yards of Serge he had; Yards of Shalloon; I demand how many Yards of Shalloon he had, and how much the Shalloon cost him per Yard? Answ. 120 Yards of Shalloon at 1 l. 15 s. 5 d. 18 per yd.

Quest. 22. An Oilman bought three Tuns of Oil, which cost him 151 l. 14 s. and so it chanced that it leaked out 85 Gallons; but he is minded to sell it again, so that he may be no Loser by it; I demand how he must sell it per Gallon? Answer, at 4 s. 6 d. \(\frac{1}{27} \frac{4}{4} \) d. per Gallon.

Quest. 23. Bought 9 Packs of Cloth, each Pack containing 12 Cloths, which at 8 s. 4 d. Ell Flemish, cost 1080 l. I demand how many Yards there were in each

Cloth? Answer 27 Yards in each Cloth.

Queft.

Quest. 24. A Gentleman hath 536 l. per Ann. and his Expences are, one Day with another 18 s. 10 d. 3 grs. If defire to know how much he layeth up at the Year's End?

Answer 191 l. 3 s. 8 d. 1 gr.

Quest. 25. A Gentleman expendeth daily one Day with another 27 s. 10 d. $\frac{1}{2}$, and at the Year's End layeth up 340 l. I demand how much is his yearly Income? An-

swer 848 l. 14 s. 4 d. 1.

Quest. 26. If I sell 24 Yards for 10 1. 10 s. how many Ells Flemish shall I sell for 283 1. 17 s. 6 d. at that Rate?

Answer 504 3 Ells Flemish:

Quest. 27. If 100 l. in 12 Months, gain 6 l. Interest, how much will 75 l. gain in the same Time, and at the same Rate? Answer 4 l. 10 s.

Quest. 28. If 100 1. in 12 Months gain 6 1. Interest, how much will it gain in 7 Months at that Rate? Answer

3 % 10 5.

Chap. 10 By this time the Learner is, as I suppose well exercised in the Practick and Theorick of the Rule of Three Direct; but at his Leifure he may look over the following Questions whose Answers are given, but the Operation purposely a mitted as a Touchitone for the Learner, thereby to try his Ability in what hath been deliver'd in the former Rules,

Queft. 16. If 24 1. of Raifins cost 6 s. 6 d. what will 18 Frails coft, each weighing neat 3 grs. 18 1. Anf. 24h

17 s. 3 d.

Quest. 17. If an Ounce of Silver be worth 5 Shillings. what is the Price of 14 Ingots, each Ingot weighing 71 5 12. 10 p.w. Answer 313 1. 5 s.

Quest. 18. If a Piece of Cloth cost 101. 16 s. 8 d. Ide mand how many Ells Engl. there are in the same, when the Ell at that Rate is worth 8 s. 4 d. Answer, 26 Ells English.

Quest. 19. A Factor bought 84 Pieces of Stuffs, which cost him in all 537 1. 12 s. at 5 s. 4 d. per Yard, I demand how many Yards there were in all, and how many Ells English were contained in a Piece of the same? Answer 2016 Yards in all, and 19 1 Ells of English per Piece.

Queft. 20. A Draper bought 242 Yards of Broad-cloth, which cost him in all 254 1. 10 s. for 86 Yards, of which he gave after the Rate of 21 s. 4 d. per Yard. I demand how much he gave per Yard for the Remainder? Answer

20 s. 9 d. 154 per Yard.

Quest. 21. A Factor bought a certain Quantity of Serge and Shalloon, which together cost him 126 1. 14 s. 104 The Quantity of Serge he bought was 48 Yards, at 41. 4 d. per Yard; and for every two Yards of Serge he had; Yards of Shalloon; I demand how many Yards of Shalloon he had, and how much the Shalloon coft him per Yard? Answ. 120 Yards of Shalloon at 1 1. 15 s. 5 d. 13 per yd.

Quest. 22. An Oilman bought three Tuns of Oil, which cost him 151 1. 14 s. and so it chanced that it leaked out 85 Gallons; but he is minded to fell it again, so that he may be no Loser by it; I demand how he must fell it per Gallon? Answer, at 4 s. 6 d. 174 d. per Gallon.

Quest. 23. Bought 9 Packs of Cloth, each Pack com taining 12 Cloths, which at 8 s. 4 d. Ell Flemish, coll 1080 1. I demand how many Yards there were in each

Cloth? Answer 27 Yards in each Cloth.

Queft.

Quest. 24. A Gentleman hath 536 l. per Ann. and his Expences are, one Day with another 18 s. 10 d. 3 qrs. If desire to know how much he layeth up at the Year's End?

Answer 191 l. 3 s. 8 d. 1 qr.

Quest. 25. A Gentleman expendeth daily one Day with another 27 s. 10 d. \(\frac{1}{2}\), and at the Year's End layeth up 340 l. I demand how much is his yearly Income? An-

Quest. 26. If I sell 24 Yards for 10 l. 10 s. how many Ells Flemish shall I sell for 283 l. 17 s. 6 d. at that Rate?

Answer 504 2 Ells Flemish:

Quest. 27. If 100 1. in 12 Months, gain 6 1. Interest, how much will 75 1. gain in the same Time, and at the

same Rate? Answer 4 1. 10 s.

Quest. 28. If 100 1. in 12 Months gain 6 1. Interest, how much will it gain in 7 Months at that Rate? Answer 3 1. 10 s.

Quest. 29. A certain Usurer put out 73 l. for 12 Months, and received Principal and Interest 81 l. I demand what Rate per Cent. he received interest? Answer 8 l. per Cent.

weigh'd near 18 C. 3 grs. 14 l. at 2 l. 6 s. 8 d. per C. the other weigh'd near 18 C. 1 gr. 21 L at 4 d. \frac{1}{2} per l. which he mingled together; now I defire to know how much a C. wt. of this Mixture is worth? Anf. 2 l. 4 s. 2\frac{5}{2}\frac{7}{2} qrs.

Quest. 31. Two Men, viz. A and B departed both from one Place, the one goes East, and the other West; the one travelleth 4 Miles a Day, and the other 5 Miles a Day, how far are they distant the 9th Day after their

Departure? Answer 81 Miles.

Quest. 32. A flying every Day 40 Miles, is pursued the fourth Day after by B, posting 50 Miles a Day; now the Question is, in how many Days, and after how many Miles Travel, will A be overtaken?

Answ. B overtakes him in 32 Days, when they have travelled 600 Miles. See More's Arithm. cap. 8. qu. 7.

ontained in the Definition of the fame, that is, to find a fourth Number in Proportion, confisting of two equal Reasons; as hath been fully shewn in all the foregoing Examples.

F 5

The -

The second Effect is, by the Price or Value of one Thing, to find the Price and Value of many Things of like Kind.

The third Effect is, by the Price or Value of many Things, to find the Price of one; or by the Price of many Things, (the faid Price being one) to find the Price of many Things of like Kind.

The 4th Effect is, by the Price or Value of many Things to find the Price or Value of many Things of like Kind.

The 5th Effect is, thereby to reduce any Number of Monies, Weights, or Measures, the one Sort into theo ther, as in the Rules of Reduction contained in the 8th Chapter foregoing. Examples of its various Effects have been already answered.

12. The Rule of Three Direct, is thus proved, viz. Multiply the first Number by the 4th, [The Proof of the Rule of Three Direct. and note the Product; then multiply the 2d Number by the 3d, and if this Product is equal to the Product of the 1st and 4th, then the Work is right

ly performed, otherwife it is erroneous.

So the first Question of this Chapter (whose Answer or 4th Number we found to be 18 s.) is thus proved, viz. the first Number is 4, which multiplied by 18 (the 4th) produced 72, and the 2d and 3d Numbers are 12 and 16, which multiplied together produceth 72, equal to the Product of the 1st and 4th, and therefore I conclude the Work to be rightly performed.

Always observing, That it any Thing remain after you have divided the Product of the 2d and 3d Numbers by the first, such Remainder in proving the same, must be added to the Product of the 1st and 4th Numbers, whole Sum will be equal to the Product of the second and third, the second Number being of the same Denomination with the fourth, and the first of the same Denomination with

the third.

So the fourth Question of this Chapter being again to peated, viz. If 142 1. of Tobacco cost 27 s. what will 478 1. cost at that Rate? The Answer, (or fourth Num ber) was 46 1. 1 s. 10 d. 1 gr. -1, which is thus proved; wiz. bring the 4th Number into Farthings, and it makes 44294, which multiplied by the first Number 14, produceth 478 first ratio Rul Soct

1

Chap. 11. The Single Rule, &c: 107 duceth 619488 (the fecond which remaineth being added thereto;) then (because I reduce my fourth Number into Farthings) I reduce my second, (viz. 27 s.) into Farthings, and they are 1296, which multiplied by the 3d Number 478, their Product is 619488, equal to the Product of the first and fourth Numbers. Wherefore I conclude the Operation to be true. This is an infallible Way to prove the Rule of Three Direct, and it is reduced from the 12th

And thus much for this inestimable Rule of Three Direct, the Demonstration of which may be seen in Kersey's Appendix to Wingate's Art. in. and in the 6th Chapter of:

Oughtred's Clavis Mathematica.

CHAP. XI. The Single Rule of Three Inverse.

when there are 3 Numbers, given to find a 4th in fuch Proportion to the 3 given Numbers, so as the 4th proceeds from the 2d according to the same Rate, Reason, or Proportion, that the first proceeds from the third, or the Proportion is,

As the 5th Number is in Proportion to the 2d, so is the

ist to the 4th. See Alfted. Matth. 1. 2. c. 14.

So if the 3 Numbers given were 8, 12, and 16, and it were required to find a fourth Number in an inverted Proportion to these, I say, that as 16 (the third Number) is the Double of the first Term or Number (8) so must 12, the second Number, be the double of the fourth; so will you find the sourth Term or Number to be 6. (And as in the Rule of Three Direct) you multiply the second and third together, and divide their Product for a sourth proportional Number.

2. In the Rule of Three Inverse, you must multiply the second Term by the first, or first Term by the second, and divide the Product thereof by the first Term, so the Quotient will give you the 4th Term sought in an invested Proportion. The same Order being observed in this Rule, as in the Rule of Three Direct, for placing and disposing of the

given:

Ha to the that a than Weig

Weig

quire

the \

and

Whe

80

Wor

Cha

Chap. 11.

given Numbers, and after your Numbers are placed in order, that you may know whether your Question be to be resolved by the Rule Direct or Inverse, observe the general Rule following.

3. When your Question is stated, and your Numbers orderly disposed, Consider in the first Place, whether the fourth Term or Number sought, ought to be more or less than the second Term; which you may easily do: And is it is required to be more or greater than the 2d Term, then the lesser Extream must be your Divisor; but if it requires less, then the highest Extream must be your Divisor; in this Case, the 1st and 3d Numbers are called Extreams (in respect of the second) and having found out your Divisor, you may know whether your Question belong to the Rule Direct or Inverse; for if the 3d Term be your Divisor, then it is Inverse; but if the 1st Term be your Divisor, then it is a direct Rule. As in the sollowing Questions.

Quest. 1. If & Labourers can do a certain Piece of Work in 12 Days, in how many Days will 16 Labourers do the

same? Answer, in 6 Days.

Having placed the Numbers according to the 6th Rule

of the 10th Chapter, I consider, that if 8 Men can finish the Work in 12 Days, 16 Men will do it in lesser (or sewer Days) than 12, therefore the biggest Extream must be the Divisor, which is 16, and therefore it is the Rule of Three Inverse; wherefore I multiply the 1st and 2d Numbers together, viz. 8 by 12, and their Product is 96, which divided by 16,

quotes 6 Days for the Answer; and in so many Days will 10 Labourers perform a Piece of Work, when 8 Men can do it in 10 Days

do it in 12 Days.

Quest. 2. If, when the Measure, viz. (a Peck) of Wheat cost 2 s. the I enny-loaf weighed (according to the Standard Statute or Law of England) 8 Ounces, I demand how much it will weigh when the Peck is worth 1 s. 6 d. according to the same Rate or Proportion? Answer 10 cz. 23 p.w. 8 gr.

14

Having placed and reduced the given Numbers according to the 6th and 9th Rules of the 10th Chapter, I confider that at 1s. 6d. per Peck, the Penny-loaf will weigh more than at 2s. per Peck; for as the Price decreaseth, the Weight increaseth; and as the Price increaseth, so the Weight diminishes; wherefore because the first Term requires more than the second, the lesser Extream must be the Divisor, viz. 1s. 6d. or 18d. and having finished the Work, I find the Answer to be 100z. 13 p.m. 8 gr. and so much will the Penny-loaf weigh when the Peck of Wheat is worth 1s. 6d. according to the given Rate of 8 Ounces, when the Peck is worth two Shillings. The Work is plain in the following Operation.

d. cz. gr.

If 24 8 18

8 cz. pw. gr.

18) 192 (10 13 8 Answ.

144 (8 gr. 144

(o)

20 s. per Piece, are to be given or received for 240 Pieces, the Value or Price of every Piece being 12 Shillings? Answer 144 Pieces. For if 12 s. required 240 Fieces, then 20 s. will require less; therefore the bigger Extream must be the Divilor, which is the third Number,

&c. See the Work as in the

Margent.

Quest. 4. How many Yards of 3 Quarters broad are required to double, or be equal in Measure to 30 Yards, that are 5 Quarters broad? Answer 50 Yards. For fay, if 5 Quarters will require 30 Yards long, what Length will 3 Quarters broad require? Here I consider that 3 Quarters broad will require more Yards than 30; for the narrower the Cloth is, the more in length will go to make equal Measure with abroa-

grs. long 918.

der Piece. Quest. 5. At the Request of a Friend, I lent him 200% for 12 Months; promising to do me the like Courtely at my Necessity; but when I came to request it of him, he could let me have but 150 1. now I defire to know how long I may keep this Money to my plenary Satisfaction for my former Kindness to my Friend; Answer 16 Months, I fay, If 2001. will require 12 Months, what will 1501. require; 150 1. will require more Time than 12 Morths, therefore the lesser Extream, (viz. 150) must be the Divifor; multiply and divide, and you will find the fourth inverted proportional to be 16, and so many Months I ought to keep the 150 l. for Satisfaction.

Quest. 6. If for 24s. I have 1200 1. Weight carried 36 Miles, how many Miles shall 1800 1, be carried for the fame Money? Answer 24 Miles.

Quest. 7. If for 24 s. I have 1200 l. mt. carried 36 Miles, how many 1. mt. shall I have carried 24 Miles for the same Money? Answer 1800 l. weight.

Quest. 8. If 100 Workmen in 12 Days finish a Piece of Work or Service, how many Workmen are sufficient to do

the same in 3 Days? Answer 400 Workmen.

n. ht Quest. 9. A Colonel is besieged in a Town, in which are 1000 Soldiers, with Provision of Victuals only for three Months; the Question is, How many of his Soldiers must be dismiss, that his Victuals may last the remaining Soldiers 6 Months? Answer 500 he must keep, and dismiss as many.

Quest. 10. If 20 1. worth of Wine is sufficient for the Ordinary of 100 Men, when the Tun is sold for 30 1. how many Men will the same 20 1. worth suffice, when

the Tun is worth 24 l. Answer 125 Men.

Quest. 11. How much Plush is sufficient for the Cloak, which hath in it 4 Yards of 7 Quarters wide, when the Plush is but 3 Quarters wide? Answer 9 \frac{1}{2} Yards of Plush.

Quest. 12. How many Yards of Canvas that is Ell wide, will be sufficient to line 20 Yards of Say, that is 3 Quar-

ters wide? Answer 12 Yavds.

Lueft. 13. How many Yards of Matting that is 2 Foot wide, will cover a Floor that is 24 Foot long, and 20 Foot

broad? Answer 240 Foot.

Quest. 14. A Regiment of Soldiers, consisteth of 1000, and to have new Coats, and each Coat to contain two Yards two Quarters of Cloth that is 5 Quarters wide, and they are to be lined with Shalloon that is 3 Quarters wide, I demand how many Yards of Shalloon will line them?

Answer 16666 1 Quarters, or 4166 3 Yards.

Quest. 15. A Messenger makes a Journey in 24 Days, when the Day is 12 Hours long: I desire to know in how many Days he will go the same when the Day is 16 Hours

long? Answer in 18 Days.

Quest. 16.1 borrowed of my Friend 64 1. for 8 Months, and he hath Occasion another Time to borrow of me for 12 Months. I desire to know how much I must lend to make good his former Kindness to me? Answer, 42 1. 13 1. 4 d.

Chap. 11

4. The general Effect of the Rule of Three Inverie, is contained in the Definition of the same, that is, to find a fourth Term in a Reciprocal Proportion inverted to the

Proportion given.

The 2d Effect is, by two Pieces, or Value of two feweral Pieces of Money and Merchandize known, to find how many Pieces of the one Price is to be given for some of the other. And so to reduce and exchange one Sort of Money or Merchandize into another. Or else to find the Price unknown of any Piece given to exchange in reciprocal Proportion.

The 3d Effect is, by two different Prices of a Measure of Wheat bought or fold, and the Weight of a Loaf of Bread, made answerable to one of the Prices of the Measure given, to find out the Weight of the same Loaf artiserable to the other Price of the said Measure given.

Or else, by the two several Weights of the same priced Loaf, and the Price of the Measure of Wheat answerable to one of those Weights given, to find out the other Price of the Measure answerable to the other Weight of the same Loaf.

The 4th Effect is, by two Lengths, and one Breadth of two Rectangular Planes known, to find out another Breadth unknown. Or, by 2 Breadths, and one Length given, to find out another Length unknown in an inverted Proportion.

The 5th Effect is, by double Time, and a capital Sum of Money borrowed or lent, to find out another capital Sum answerable to one of the given Times; or otherwise, by two capital Sums, and a Time answerable to one of them given, to find out a Time answerable to the other

capital Sum in reciprocal Reason.

The 6th Effect is, by two different Weights of Carriage, and the Distance of the Place in Miles or Leagues given, to find another Distance in Miles answerable to the same Price of Payment. Or otherwise, by two Distances in Miles, and the Weight answerable to one of the Distances (being carried for a certain Price) to find out the Weight answerable to the other Distance for the same Price.

The 7th Effect is, by double Workmen, and the Time

ver-

ine

wer-

answerable to one of the Numbers of Workmen given, to find out the Time answerable to the other Number of Workmen, in the Performance of any Work or Service: Or contrariwise, by double Time, and the Workmen answerable to one of those Times given, to find out the Nunher of Workmen answerable to the other Time, in the

Performance of any Work or Service.

Also by a double Price of Provision, and the Number of Men, or other Creatures, nourished for a certain Time answerable to one of the Prices of Provisions given, to find out. another Number of Men or other Creatures answerable to the other Price of the Provision for the same Time. contrariwife, by two Numbers of Men, or other Creatures. nourished, and one Price of Provision answerable to one of the Numbers of Creatures given, to find out the other Price of the same Provision answerable to the other Number of Creatures, both being supposed to be nourished for the fame, Vc.

To prove the Operation of the Rule of Three Inverse. multiply the 3d and 4th Terms together, and note their. Product; and multiply the 1st and 2d together, and if their Product is equal to the Product of the 3d and 4th, then is the Work truly wrought, but if it falleth out other-

wife, then it is erroneous.

As in the first Question of this Chapter 16 (the 3d Number) being multiplied by 6 (the 4th Number) the Product is 96, and the Product of 8, (the first Number) multiplied by 12, (the 2d Number) is 96, equal to the first Product, which proves the Work to be right.

And note, That if in Division any Thing remain, such Remainder must be added to the Product of the third and fourth Terms, and if the Sum be equal to the Product of the first and second (the Homogeneal Terms being of one Denomination) the Work is right:

CHAP. XII.

The Double Rule of Three Direct.

WE have already delivered the Rule of fingle Proportion, and we come now to lay down the Rules of Plural Proportion. 1. Plural

ofit

eithe

Nue

Nan

the f

oth

will

B

then

and

T

1. Plural Proportion is, when more Operations in the place Rule of Three than one are required before a Solution on of T be given to the Question propounded. Therefore in Que der, stions that require Plurality in Proportion, there are a greft ways given more than three Numbers.

2. When there are given five Numbers, and a fixth a 61. required in Proportion thereunto, then the fixth Propon bust tion is faid to be found out by the Double Rule of Three,

as in the Question following, viz.

If 100 1. in 12 Months gain 6 1. Interest, how much

will 75 l. gain in 9 Months?

2. Questions in the Double Rule of Three, may be refolved either by 2 Single Rules of Three, or by I Single Rule of Three, compounded of the Five given Numbers.

4. The Double Rule of Three, is either Direct orelle ber i

Inverse.

5 The Pouble Rule of Three Direct is, when untof which given Numbers, a 6th proportional may be found out by bath

two fingle Rules of Three Direct.

6. The five given Numbers in the Double Rule of Three Direct confideth of two Parts, viz. 1. A Supposition, and thos adly, of a Demand; the Supposition is contained in the ther three first of the five given Numbers, and the Demand Sup lies in the two last; as in the Example of the Second Rule three of this Chapter, viz. If 100 l. in 12 Months gain 6 l. In the terest, what will 75 l. gain in 9 Months? Here the Suppler position is expressed in 100, 12, and 6, for it is said if Sup 100 1. in 12 Months gain 61. Interest: And the Demand lieth in 75 and 9, for it is demanded, How much 75 4 over will gain in 9 Months.

7. When your Question is stated, the next Thing will be to dispose of the given Numbers in due Order and Plan, as a Preparative for Resolution: Which that you may do; con First, Observe which of the given Numbers in the Supposition is of the same Denomination with the Number required, for that must be the 2d Number (in the first Operation) of the Single Rule of Three, and one of the other Numbers in the Supposition (it meeters accombined) Numbers in the Supposition (it matters not which) must por be the first Number, and that Number in the Demand 18 which is of the same Denomination with the first, must be the third Number; which three Numbers being that but placed,

aced,

laced, will make one perfect Question in the Single Ru'e of Three, as in the forementioned Example: First, I consider, that the Number required in the Question, is in the Interest or Gain of 75 l. therefore that Number in the Supposition which hath the same Name, viz.

100 6 75 must be the second Number in the first Operation, and sither 100 or 12, (it matters not which) must be the first Number; but I will take a 100; and then for the third Number, I put that Number in the Demand, which hath the same Denomination with 100, which is 75; for they both signify Pounds Principal, and then the Numbers will stand as you see in the Margent.

But if I had for the first Number put the other Numbers in the Supposition, viz. 12, which signifies 12 Months, which signifies 12 Months,

ber in the Supposition, viz. 12, which signifies 12 Months, then the third Number must have been 9, which is the Number in the Demand which at by bath the same Denomination with the first, viz. 9 Months.

and they will stand as in the Margent.

There yet remain two Numbers to be disposed of, and those are one in the Supposition, and another in the Demand; that which is of the Supposition, I place under the first of the hree Numbers; and the other which is the Demand, I place under the third Number; and then two of the Terms in the supposition will stand (one over the other) in the first place, and the two Terms in the Demand will stand (one over the other) in the first place, and the two Terms in the Demand will stand (one over the other) in the stand over the other) in the third Place, as in the Margent.

8. Having disposed or ordered the given Numbers, according to the last Rule, we may proceed to a Resolution; and first I work with the 3 uppermost Numbers, which, edo; ecording to the first Disposition, are 100, 6, and 75; which is as much as to say, If 100 1. requires 61. Interest, how much will 75 Pounds require? which by the 3d Que and 8th Rules of the 10th Chapter, I find the 4th promust and 8th Rules of the 10th Chapter, I find the 4th promust portional Number to be 41. 10 s. so that by the foregoing single Question I have discovered how much Interest 151. will gain in 12 Months; the Operation whereof solution whereof followeth on the lest Hand under the Letter A, and having

in ed B

S

discovered how much it will gain in 12 Months, we my by another Question easily discover how much it will gain in 9 Months; for this 4th Number (thus found) I put the middle between the two lowest Numbers of the 5, after they are placed according to the 7th Rule of this Chapter; and then it will be a 2d Number, in another Questionin

the Rule of Three. The Numbers being 12 4 10 9 the first and third Numbers being of one Denomination viz. both Months, and may be thus expressed; if 1st Months require 41. 10 s. Interest, what will 9 Months require? And by the 3d Rule of the 11th Chapter, I find it to be the Direct Rule, and by working according to the Directions laid down in the 7th, 8th, and 9th Rules of the 10th Chapter, I find the fourth proportional Number to last single Question, to be 31. 7 s. 6 d. which is the sixth proportional Number to the 5 given Numbers, and is the Answer to the general Question. The Work of the last single Question is expressed on the right Side of the Page under the Letter B, as solloweth.

age under the Letter B, a	s followern.
100	1-6-75
A 12	9 B
1. 1. 1.	Then fay,

l. s.	12 90
Facit 4 10	12 84
	(o) (6) d.
	Facit 3 1. 7 s. 6 d.

117

So that by the foregoing Operation, I conclude, that if 1001. in 12 Months gain 61. Interest, 75 h will gain 3 h 7s. 6d. in 9 Months, after the same Rate.

The Answer would have been the same if 12 9 9 the 5 given Numbers had been ordered actording to the second Method, viz. as you seein the Margent.

Months gain? This Question I find to be Direct, by the 3d Rule of the 11th Chapter, and by the 7th and 8th Rules of the 10th Chapter, I find the fourth proportional

Number to these three to be 4 1. 10 s.

d.

Thus have I found out what is the Interest of 100 1. for 6 Months, and I am now to find the Interest of 75 1. for 9 Months; to effect which, I make this 4th Number (found as before) to be my second Number in the next Question, I say, If 100 1. require 41. 10 s. what will 75 1. require? This Question, I find (by the said 3d Rule of the 11th Chapter) to be Direct, and by the said 7th, 8th, and 9th Rules of the 10th Chapter, I find the Answer to be as before, viz. 31. 7 s. 6 d.

The Operation of this Rule in the following Questions,

are purposely omitted, to try the Learner's Capacity.

Quest. 2. A 2d Example in this Rule may be as followeth, viz. A Carrier receiving 42 Shillings for the Carriage of 300 Weight 150 Miles, I demand how much he ought to receive for the Carriage of 7 C. 3 qrs. 4 1. 50 Miles at that Rate? Answer 36 s. 9 d.

Luest. 3. A Regiment of 136 Soldiers eat up 351 Quarters of Wheat in 108 Days, I demand how many Quarters of Wheat 11232 Soldiers will eat in 56 Days at that Rate?

Answer 1404 Quarters.

Quest. 4. If 40 Acres of Grass be moved by 8 Men in 7 Days, how many Acres shall be moved by 24 Men in

28 Days? Answer 480 Acres.

Quest. 5. If 48 Bushels of Corn (or other Seed) yield 576 Bushels in a Year, how much will 240 Bushels yield in 6 Years at that Rate? That is to say, if they were sowed 240 Bushels every one of the 6 Years? Answer 17280 Bushels.

Chap. 13 Queft. 8. If 40 Shillings is the Wages of 8 Menford Days, what will be the Wages of 32 Men for 24 Days Answer 768 Shillings, or 38 1. 8 s.

Quest. 7. If 14 Horses eat 46 Bushels of Provenderin 16 Days, how many Bushels will 20 Horses eat in a

Days? Answer 120 Bufhels.

Quest. 8. If 8 Cannons in one Day spend 48 Barrels of Powder, I demand how many Barrels 24 Cannons will found in 22 Days at that Rate? Answer 1728 Barrels,

Quest. 9. If in a Family confisting of 7 Persons, then are drunk out 2 Kilderkins of Beer in 12 Days, how man Kilderkins will there be drunk out in 8 Days, by another Family confifting of 14 Persons? Answer 48 Gallons, or

2 Kilderkins and 12 Gallons.

Quest. 10. An Usurer put 75 1. out, to receive Interest for the same, and when it had continued 9 Months, he received for Principal and Interest 78 1. 7s. 6 d. I de mand at what Rate per Cent. per Annum, he received le cerest? Answer 6 1. per Cent. per Annum.

CHAP. XIII.

The Double Rule of Three Inverse.

THE Double Rule of Three Inverse, is, when a Que 1 stion in the Double Rule of Three is resolved by two Single Rules of Three, and one of those fingle Rules falls out to be Inverse, or requires a fourth Number in Proportion reciprocal (for both Questions are never Inverfe.)

2. In all Questions of the Double Rule of Three (8 well Inverse as Direct) you are in the disposing of the ; given Numbers, to observe the 7th Rule of the 12th Chapter, and in resolving of it by two single Rules, observe to make Choice of your Numbers for the first and fingle Que stions, according to the Directions given in the 8th Rule of the same Chapter, and in the Example following, viv.

Quest. 1. If 100 l. Principal in 12 Months gain 61. Interest, what Principal will gain 31. 75. 6 d. ing

Months?

hap-

re to Que

Rule viz.

in 9

This Question is an Inversion of the first Question of the 12th Chapter, and may serve for a Proof thereof.

In order to a Resolution, I dispose of the 5 given Numbers, according to the 9th Rule of the last Chapter; and being so disposed, they will stand as followeth.

12 100 9 1. s. d.
6 3 7 6

Or thus,
1. s. d.
6 100 3 7 6

12 9

That accord- First I say,

m

Here observe, That according to the 8th Rule of the 12th Chapter, the first Question (if you take it from the 5 Numbers) as they are ordered or placed first (will be) if 12 Months require 100 1. Principal, what will 9 Months require to make the same Interest? This (according to the 3d Rule of the 12th Chapter) is Inverse, and the Answer will be found (by the 2d Rule of the 11th Chapter) to be 133 1.65.8 d. The 2d Quetion then will be, If 6 t. Interest require 1331. 6 s. 8 d. Principal; how much Principal will 31.7s. 6d. require? This is a direct Rule, and the Answer in a direct Proportion,

75 1. See the Work.

Weeks will 288 1. ferve 4 Students 8 Weeks, how many Weeks will 288 1. ferve 4 Students? Answer 144 Weeks.

Quest. 5. If when a Bushel of Wheat cost 3 s. 4 d. the Penny Loaf weigheth 12 Ounces, I demand the Weight of the Loaf worth 9 d. when the Bushel cost 10 s. Answer 36 Ounces.

Quest. 6. If 48 Pioneers in 12 Days cast a Trench 24 Yards long, how many Pioneers will cast a Trench 168

Yards long in 16 Days? Answer 252 Pioneers.

Quest. 7. If 12 C. weight being carried 100 Miles, cost 51.11 s. I desire to know how many C. weight may be carried 150 Miles for 12 1, 12 s. at that Rate? Ans. 18 C.

Quest. 8. If when Wine is worth 30 l. per Ton, 20 l. worth is sufficient for the Ordinary of 100 Men, how many Men will 4 l. worth suffice, when it is worth 24 l. per Ton? Answer 25 Men.

Quest. 9. If 6 Men in 24 Days mow 72 Acres; in how many Days will 8 Men mow 24 Acres? Ans. in 6 Days.

Quest. 10. If when the Ton of Wine is worth 301. 100 Men will be satisfied with 201. worth, I desire to know what the Ton is worth, when 41. worth will satisfy 25 Men at the same Rate? Answer 241. per Ton.

CHAP. XIV.

The Rule of Three composed of Five Numbers.

THE Rule of Three composed, is when Questions (wherein there are 5 Numbers given to find a 6th in Proportion thereunto) are resolved by one single Rule of Three composed of the 5 given Numbers.

2. When Questions may be performed by the Double Rule of Three Direct, and it is required to resolve them by the Rule of Three composed; first order or rank your Numbers according to the 7th Rule of the 12th Chap. then

The Rule is,

Multiply the Terms or Numbers (that stand one over the other in the first Place) the one by the other, and make their Product the first Term in the Rule of Three Direct; then multiply the Terms that stand one over the other in the third Place, and place their Product for the

ueft.

fay,

by I

Perl

2.

3.

Lim

the t o th

iar

T

ving found a 4th Proportiona! Direct to these three, this at Proportional so found shall be the Answer required.

So the first Question of the 12th Chapter being propos ed, viz. If 100 1. in 12 Months gain 6 1. Interest, what will 75 1. gain in 9 Months? The Numbers being ranked (or placed) as is there directed and done.

Then I multiply the two first Terms, 100 and 12, the one by the other, and their Product is 1200 for the firth Term; then I multiply the two last Terms 75 and 9 toge ther, and their Product is 675 for the third Term. Then I fay, as 1 200 is to 6, so is 675 to the Answer, which by the Rule of Three Direct, will be found to be 3 1. 7 s. 64 for

as was before found.

3. But if the Question be to be answered by the Double Rule of Three Inverse, then (having placed the five given Terms as before) multiply the lowermost Term of the first Place, by the uppermost Term of the third Place, and put the Product for the first Term; then multiply the uppr. most Term of the first Place, by the lowermost Terms the third Place, and put the Product for the third Tem, and the fecond Term of the three highest Numbers for may the middle Term to those two; then if the Inverse Pro lusta portion is found in the uppermost three Numbers, the fourth Proportional Direct to these three shall be the Am Dou fwer. So the first Question to the 13th Chapter being fa ted, viz. If 100 1. Principal in 12 Months gain 6 1. Interest, fingl what Principal will gain 31.7 s. 6 d. in 9 Months? State cach the Number as there directed in the first Order, viz.

> 100 1.

Then reduce the 61. and 31.7 s. 6 d. into Pence, the 61. Ther 1440 d. and 31.7 s. 6 d. is 810 d. then multiply 1440 by fern 9, the Product is 12960 for the first Term in the Ruled or the Three Direct, and multiply 810 by 12, the Product is the 9720, for the third Term; then I say, as 12960 is to 130 wid so is 9720 to the Answer, viz. 75 1. as before. But it, at the Terms had been placed after the second Order, where the Terms had been placed after the second Order, wh

Chap.	15.		Single	Fellowship.		123
1		1.	1.	s.	a.	
6	,	100	3	7	6	
n	n		m			
1	2		9			

Then the Inverse Proportion is found in the lowest Numbers, and having composed the Numbers for a fingle Rule of Three, as in the second Rule foregoing; then the An-(wer must be found by a fingle Rule of Three Inverse; for here it falls out to multiply 810 by 12 for the first Number, 1440 by 9 for the third Number; and then you must fay, As 9720 is to 100 L fo is 12960 to the Answer, which by Inverse Proportion will be found to be 75 1, as before.

The Question in the 12th and 13th Chapters may ferve

64 for thy farther Experience.

CHAP. XV.

Single Fellowship.

F Ellowship, is that Rule of Plural Proportion, where-by we ballance Accompts depending between diverse em, Persons, having put together a general Stock, so that they reform may every Man have his proportional Part of Gain, or Profusion his proportional Part of Loss.

the 2. The Rule of Fellowship is either fingle, or it is

e Am Double.

ng the 3. The Single Rule is, when the Stocks propounded are teret, fingle Numbers, without any Respect or Relation to Time, State each Partner continuing his Money in Stock for the same Lime.

4. In the Single Rule of Fellowship, the Proportion is, s the whole Stock of all the Partners is in Proportion to he total Gain or Lofs, fo is each Man's particular Share the Stock, to his particular Share in the Gain or Lofs. Therefore take the Total of all the Stocks for the first term in the Rule of Three, and the whole Gain or Loss Ruled or the second Term, and the particular Stock of any one dust the Partners for the third Term; then multiply and vide according to the seventh Rule of the ninth Chap-But 7, and the fourth proportional Number is the particular of the second results of the sec er, where Loss or Gain of him whose Stock you made your

fecond Number, wherefore repeat the Rule of Three as often as there are particular Stocks or Partners in the Question, and the fourth Terms produced upon the several Operations are the respective Gain or Loss of those particular Stocks given, as in the Example following.

Quest. 1. Two Persons, viz. A and B bought a Ton of Wine for 20 1. of which A paid 12 1. and B paid 8 1. and they gained in the Sale thereof 5 1. now I demand each

Man's Share in the Gains, according to his Stock.

First, I find the Sum of all their Stocks, by adding them together, viz. 12 l. and 8 l. which are 20 l. then according to this Rule, I say first, if 20 l. 12 (the Sum of their Stocks) require 5 l. the total 8 Gain, how much will 12 l. (the Stock of A) require? Multiply and divide by the 7th Rule of 20 l. the 9th Chapter, and the Answer is 3 l. for the Share of A in the Gains; then again I say, If 20 l. require 5 l. what will 8 l. require? The Answer is 2 l. which is the Gain of B, so I conclude on the Share of A to the Gain is 3 l. and the Share of B in the Gain is 2 l. which in all is 5 l.

If 20	1. 5 12	1. 12
	20) 60 (3 %	
1. If 20	(o) 1. 5	<i>l.</i> 8
20	o) 42 (l.	

Quest. 2. Three Merchants, viz. A, B, and C, entar upon a joint Adventure, A put into the common Stort 78 1. B put in 117 1. and C put in 234 1. and they find (when they make up their Accompts) that they have gained in all 264 1. now I defire to know each Man's particular Share in the Gain.

First,

3 fo

F

If in finding out the particular Shares of the several Partners, any Thing remain after Division is ended, such Remainders must be added together, (they being all Fractions of the same Denomination;) and their Sum divided by the common Divisor in each Question, viz. The total Stock, and the Quotient added to the particular Gains, and then if the total Sum is equal to the total Gain, the Work is right, otherwise not.

As in the 4th Question, the Remainders were 354, 62, and 930, which added together, make 1346, which divided by 1346, (the Sum of their Stocks) the Quotient is 1 d. which I add to the Pence, &c. and the Sum of their Share is 897 l. equal to the total Gain, wherefore I

conclude the Work is right.

CHAP. XVI.

Double Fellowship.

Ouble Fellowship, is when several Persons enter into Partnership for unequal Time; that is, when every Man's particular Stock hath Relation to a particular Time.

2. In the Double Rule of Fellowship, multiply each particular Stock by its respective Time, and hand added the several Products together, make their Sum the first Number (or Term) in the Rule of Three, and the total Gain or Loss the second Number, and the Product of any one's particular Stock by his Time, the third Term, and the fourth Number in Proportion thereunto is his particular Gain or Loss, whose Product of Stock and Time is your third Number.

Then repeat (as in Single Fellowship) the Rule of Three, as often as there are Products (or Partners) and the four Terms thereby invented, and the Numbers required.

Quest. 1. A. and B. enter Partnership; A. put in 401. for 6 Months, B. put in 75 1. for 4 Months, and they gained 701. Now I demand each Man's Share in the Gain, porportional to his Stock and Time? Answer A. 201. B. 501.

1911

CHAP. XVII.

Alligation Medial.

1. THE Rule of Alligation is that Rule in Plural Proportion by which we refolve Questions, wherein is a Composition or Mixture of diverse Simples, as also it is useful in Composition of Medicines, both for Quantity, Quality, or Price: And its Species are two, viz. Medial and Alternate.

2. Alligation Medial, is, when having the several Quantities and Prices of several Simples propounded, we discover the mean Price or Rate of any Quantity of the Mixture compounded of those Simples, and the Proportion is,

As the Sum of the Simples to be mingled is to the total Value of all the Simples, so is any Part or Quantity of the Composition or Mixture to its mean Rate or Price.

Quest. 1. A Farmer mingled 20 Bushels of Wheat at 5 s. per Bushel, and 36 Bushels of Rye at 3 s. per Bushel, with 40 Bushels of Barley at 2 s. per Bushel, now I defire to know what one Bushel of that Mixture is worth?

To resolve this Question, add together the given Quantities, and their Value, which is 96 Bushels, whose total Value is 14 1. 8 s. as appeareth by the Work sollowing. For,

Bushels

20 of Wheat, at 5 s. per Bushel, is 5 0

26 of Rye, at 3 s. per Bushel, is 5 8

40 of Barley, at 2 s. per Bushel, is 4 0

The Sum of their given 26, and their Value is,

Quantities is

Then say, by the Rule of Three Direct, if 96 Bushels cost, or is worth 141. 85. what is one Bushel worth?

Chap. 17.

bush. 1. s. bush. 96 14 8 1 bush

20

96) 288 (35.

288 Facit 3 s. per Bushel.

(0)

Quest. 2. A Vintner mingled 15 Gallons of Canary at 8.s. per Gallon, with 20 Gallons of Malaga, at 7.s. 6d. per Gallons, with 10 Gallons of Malaga, at 6.s. 8 d. per Gallon, and 24 Gallons of White-wine at 4.s. per Gallon: Now I demand what a Gallon of this Mixture is worth? Work as in the last Question, and you will find the Answer to be 6.s. 2 d. 2 qrs. 46.

Quest. 3. A Grocer hath mingled 2 C. of Sugar at 56 s, per C. with 3 C. of Sugar at 3.1. 14 s. 8 d. per C. and with 6 C. at 1 l. 17 s. 4 d. per C. I desire to know the Price of

a C. wt. of that Mixture.

Answer 2 l. 13 s. 1 d. $\frac{7}{7}$.

3. The Proof of this Operation, is by the Price of any Quantity of the Mixture, to find out the total Value of the whole Composition, and if it is equal to the total Value of the several Simples, the Work is right, otherwise not. [The Proof of Alligation Medial.] As in the first Example, the Answer to the Question was that 3 s. is the Price of I Bushel; wherefore I say, by the Rule of Proportion, if I Bushel be 3 s. what is 96 Bushels? Answer 14 l. 8 s. which is the total Value of the several Simples: Wherefore the Work is right.

CHAP. XVIII.

Alligation Alternate.

Lligation Alternate is, when there are given the particular Prices of several Simples, and thereby we discover such Quantities of those Simples, as being mingled together, shall bear a certain Rate propounded.

2. When

Pr ma

ing

36 Bu mi

20 be

lafi

lin cer

me

the

32

fev

the

for the

the

fiti

32 lin

4,

2. When such a Question is stated, place the given Prices of the Simple one over the other, and the propounded Price of the Composition against them in such Sort, that it may represent a Root, and they as so many Branches spring-

ing from it, as in the following Example.

Quest. 1. A certain Farmer is desirous to mix 20 Bushels of Wheat at 5 s. or 60 d. per Bushel, with Rye at 3 s. or 36 d. per Bushel, and with Barley at 2 s. or 24 d. per Bushel, and Oats at 1 s. 6 d. per Bushel, and defireth to mix such a Quantity of Rye, Barley and Oats, with the 20 Bushels of Wheat, as that the whole Composition may be worth 2 s. 8 d. or 32 d. per Bushel.

The Prices of the Simples being placed according to the last Rule (with the Price of the Composition propounded

as a Root to them) will stand as followeth,

60 Pence 3^{2} $\begin{cases}
3^{6} \\
2^{4} \\
18
\end{cases}$

th of

ny

of

iue

ot.

mrice on,

85.

ere-

the .

reby

being

Vhen

d.

3. Having thus placed the given Numbers, you are to link the several Rates of the Simples one to the other, by certain Arches, in such Sort, that one that is lesser than the mean Rate, may be coupled to another that is greater than the mean Rate; so the Question last propounded will stand,

3. Or thus, 1. Thus, 2. Or thus, C60 -32 24 18 (18.

4. Then take the Difference between the Root and the several Branches, and place the Difference of each against the Number or Branch with which it is coupled or linked, and having taken all the Differences and placed them as aforelaid, then those Defferences so placed, will shew you. the Number of each Simple to be taken to make a Compofition to bear the mean Rate propounded.

So the Branches of the last Question being linked together, as in the Manner, I say, the Defference between 32 and 60, is 28; which I put against 18, because 60 is linked with 18, then the Desference between 32 and 36 is 4, which I put against 24, because 36 is linked or coupledd which I place against 60; and then the Work will stand

as you see in the Margent.
So I conclude that a Composition made of 14 Bushels of Wheat at 6 d. per Bushel, and 8 Bushels of Rye at 36d. per Bushel, and 5 Bushels of Barley at 24 d. per Bushel, and 28 Bushels of Oats at 18 d. per Bushel, will bear the mean Price of 32 d. or 2 s. 8 d. per Bushel. And here observe, That in the Composition there is but 14 Bushels of Wheat; but I would mingle 20 Bushels, and this Kind (or rather Case) of Alligation Alternate, (viz.) when there is given a certain Quantity of one of the Simples, and the Quanties of the rest sought to mingle with this given Quantity, (that the whole may bear a Price propounded)

And the Proportion to find out the several Quantities to

be mingled with the given Quantity, is thus.

As the Difference annexed to the Branch, that is, the Value of an Integer of the given Quantity, is to the other particular Differences, so is the Quantity given to the several Quantities required.

So here, to find how much Rye, Barley, and Oats, mult be mingled with the 20 Bushels of Wheat, I say, by the Rule of Three direct, if 14 Bushels of Wheat require? Bushels of Rye, what will 20 Bushels of Wheat require?

Answer 11 16 Bushels of Rye.

is called Alternation Partial.

Again, If 14 Bushels of Wheat require 4 Bushels of Barley, what will 20 Bushels of Wheat require? Ans. 5 10 Bushels of Barley. Again, I say, if 14 Bushels of Wheat require 28 Bushels of Oats, what will 20 Bushels of Wheat require? Answer 40 Bushels of Oats.

And now I say, that 20 Bushels of Wheat mingled with 11 - Bushels of Rye, and 5 12 Bushels of Barley, and 40 Eushels of Oats, each bearing the Rate as aforesaid, will make a Composition or Heap of Corn, that may yield 22

a.per Bushel.

th

W

But if the Branches had been coupled according to the fecond Order, or Manner, the Differences would have been thus placed, viz. the Difference

been thus placed, viz. the Difference between 33 and 60 is 28, which I fet against 24, because 60 is linked thereto; and the Difference between 32 and 36 is 4, which I set against 18; and the Difference between 32

 $3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \begin{vmatrix} 8 \\ 14 \\ 28 \\ 4 \end{vmatrix}$

and 24 is 18, which I fet against 60; then the Difference between 32 and 18 is 14, which I set against his Yoke-sellow 36; and then I conclude, that if you mixt 8 Bushels of Wheat with 14 Bushels of Rye, 28 Bushels of Barley, and 4 Bushels of Oats, each bearing the aforesaid Prices, the whole Mixture may be sold for 32 d. per Bushel, as by the

Work in the Margent.

Bar-

neat of

vich 1 40

will 22

Ew

You see by this Work we have found how many Bushels of Rye, Barley, and Oats, ought to be mixed with 8 Bushels of Wheat, and to find out how many of each ought to be mixed with 20 Bushels of Wheat, I say, as I is to 14, so is 20 to 35 Bushels of Rye. As 8 is to 28, so is 20 to 70 Bushels of Barley. As 8 is to 4, so is 20 to 10 Bushels of Oats; whereby I conclude, that if to 20 Bushels of Wheat I put 35 Bushels of Rye, 70 Bushels of Barley, and 10 Bushels of Oats, bearing each the aforesaid Price per Bushel, that then a Bushel of this Mixture will be worth 32 d. or 2 s. 8 d.

And if the Branches had been linked, as you see in the 3d Place, where each Branch bigger than the Root is link'd to two that are lesser than the Root, then in this Case you must have placed the several Differences between the Root and Branches, against those two with which each is coupled; as first, the Difference between 32 and 60 is 28, which I set against 24 and 18, because it is coupled with them

both; then the Difference between 32 and 36 is 4, which I fet likewise against 3, and 18, because 36 is linked to them both, then the Difference between 32 and 24 is 8, which I put against 60 and 36, because 24 is linked to them.

them both, then the Difference between 32 and 18 is 14, which I put against 60 and 36, the Yoke-Fellows of 18.

Lastly, I draw a Line behind the Differences, and add the Differences which stand against each Branch, and put the Sum behind the said Line against its proper Branch, as

you fee in the Margent.

And now by this Work, I find that 22 Bushels of Wheat mingled with 22 Bushels of Rye, and 32 Bushels of Barley, and 32 Bushels of Oats, each bearing the said Price, will make a Mixture bearing the mean Rate of 32 d. per Bushel.

And to find how much of each of the rest must be ming.

led with 20 Bushels of Wheat; I say,

As 22 is to 32, so is 20 to 29 Bushels of Rye. As 22 is to 32, so is 20 to $19\frac{1}{3^{\frac{1}{2}}}$ Bushels of Barley. As 22 is to 32, so is 20 to $29\frac{1}{3^{\frac{1}{2}}}$ Bushels of Oats.

Whereby you see the Questions of Alligation Alternate, will admit of more true Answers than one; for we have

found 3 several Answers to this 1st Question.

The Proof of Alternation Partial.

Questions of Alligation Partial are proved the same Way with Questions in Alligation Medial, which you may fee in the 3d Rule of the 17th Chapter.

Quest. 3. A Grocer hath 4 Sorts of Sugar, viz. of 12 d. per 1. of 10 d. per 1. of 6 d. per 1. and of 4 d. per 1. and would have a Composition worth 8 d. per 1. the whole Quantity whereof should contain 144 l. made of these sour

Sorts, I demand how much of each he must take.

Questions of this Nature are resolved by that Part of Alligation Alternate, called by Arithmeticians Alligation To

tal, viz. where there is given the Sum and Prices of feveral Simples, to find out how much of each Simple ought to be taken to make the faid Sum or Quantity, so that it may bear a certain?

bear a certain Rate propounded.

To refolve this Question, I place the several Prices of the Simples and Mean Rate propounded, and link them together, as is directed in the 2d and 3d Rules of this Chapter, and place the Differences between the Root and Branches, according to the 4th Rule of this Chapter, which will then stand one of these 3 Ways, viz.

have

12 /

ed 1

fore

Cor

ces,

Qu

take

10

wi

80

fiv

48

Q

th

of

A

5. Then add the several Differences together, which I have done, and the Sums of the first and second Order are 12 l. and of the 3d, 24 l. as you see above. But it requied that there should be 144 l. of the Composition, therefore to find the Quantity of each Simple to make the whole Composition 144 l. Observe this general Rule, viz.

As the Sum of the Differences is to the feveral Differences, so is the total Quantity of the Composition to the Quantity of each Simple.

So to find how much of each Sort of Sugar I ought to

take to make 144 1. at 8 d. per 1.

ices

1cm

nap-

ran-

nich

ind

As 12 is to 4, fo is 144 to 48 l. at 12 d. per l.

As 12 is to 2, so is 144 to 24 l. at 10 d. per l. As 12 is to 2, so is 144 to 24 l. at 6 d. per l.

As 12 is to 4, fo is 144 to 48 1. at 4 d. per 1.

Whereby I find that 48 l. at 12 d. per l. and 24 l. at 10 d. per l. and 24 l. at 6 d. per l. and 48 l. at 4 d. per l. will make a Composition of Sugar containing 144 l. worth 8 d. per l.

But as the Branches are linked in the 2d Order, the Anfiver will be 24.1. at 12 d. per 1. and 48 l. at 10 d. per 1. and 48 l. at 6 d. per 1. and 24 l. at 4 d. per 1. to make the faid

Quantity, and to bear the faid Price.

And if you had worked as the Branches are linked from the third Order, then you would have found the Quantity of 36 1. of each.

Quest. 3. A Vintner hath four forts of Wine, viz. Canary

at 10 s. per Gallon, Malaga at 8 s. per Gallon, Rhenishwine at 6 s. per Gallon, and White-wine at 4 s. per Gallon, and he is minded to make a Composition of them all of 60 Gallons, that they may be worth 5 s. per Gallon, I desire to know how much of each he must have?

The Number of Terms being ranked according to the fecond Rule of this Chapter, the Branches will be linked as followeth; but will admit of no other manner of coupling, because there is but one Branch that is lesser than the Root; therefore all the rest must be linked unto it; and

the Differences between the Root and the three first Branches, viz. 10, 8, and 6, which are 5, 3, and 1, must be set against 4, because they are coupled with it,

 $\begin{cases} \begin{array}{c} 1 \\ 8 \\ 6 \\ 4 \\ \end{array} \right] \begin{bmatrix} 1 \\ 1 \\ 1 \\ 5, 3.1. \\ 0 \\ \end{array}$

for

Su

22

and the Difference between the Root, (viz.) 5 and 4 which is 1, must be set against the 3 other, because it is linked to them all; so I find 1 Gallon of Canary, 1 Gallon of Malaga, 1 Gallon of Rhenish-wine, and 9 Gallons of White-wine, prized as above, being mingled together, will be worth 5 s. per Gallon, the Sum being 12 Gallons; but there must be 60 Gallons; whereof I say,

As 12 is to 1, so is 60 to 5 Gallons of Canary. As 12 is to 1, so is 60 to 5 Gallons of Malaga. As 12 is to 1, so is 60 to 5 Gallons of Rhenish. As 12 is to 9, so is 60 to 45 Gal. of White-wine.

fo that 5 Gallons of Canary, 5 Gallons of Malaga, 5 Gallons of Rhenish, and 45 of White-wine, mingled together, will be in all 60 Gallons worth 5 s. per Gallon, which was

required.

Quest. 4. A Goldsmith hath Gold of four several Sorts of Fineness, v.z. of 24 Carects fine, and of 22 Carects fine, of 20 Carects fine, and of 15 Carects fine. [Read Chap. 2. Def. 2. of this Book.] And he would mingle so much seach with Allay, that the whole Mass of 28 Ounces of Gold so mingled, may bear 17 Carects fine. I demand how much of each he must take? The 2d and 3d Rules of this Chapter being observed; (for instead of the Allay I put 0, because it bears no Fineness, but it makes a Branch in the Operation) the Ferms may be alligated, and the Differences added by any of these 4 Ways following, viz.

First thus, Sum 56 Secondly thus,

2, 17

Sum 56 Thirdly Thus,

> Sum 41 Fourthly thus,

2, 17, 2, 17,

Sum 87

More Ways may be given for the alligating or linking of the Terms in this Question, but these, if well practised, are sufficient for understanding the Rules of Alligation.

In Questions of Alligation Total the Answer is given true, when the Sum of each of the Quantities of Simples found, [The Proof of Alternation Total] agrees with the Sum or Quantity propounded; as in the last Question, the Answer was 8 07. 10 p. w. of 24 Carects fine, 10 07. of 22 Carects fine, 9 17. 10 p. w. of 20 Carects fine, 4 of

CHAP. XIX.

Reduction of Vulgar Fractions.

1. W HAT a Vulgar Fraction is, hath been already shewed, in the first Chapter of this Book, to which I refer the Reader to look cautiously into.

2. To reduce a Vulgar Fraction, observe carefully

these 8 following Rules.

1. To reduce a mixt Number into an improper Fraction.

2. To reduce a whole Number into an improper Fraction.

3. To reduce an improper Fraction into its equivalent Whole, (or Mixt) Number.

4. To reduce a Fraction into the lowest Terms equiva-

lent to the Fraction given.

5. To find the Value of a Fraction in the known Parts of Coin, Weight, Measure, &c.

6. To reduce a Compound Fraction to a Simple one of

the same Value.

7. To reduce diverse Fractions having unequal Denominations, to Fractions of the same Value, having an equal Denominator.

8. To reduce a Fraction of one Denomination to another

of the same Value.

I. To reduce a mixt Number to an improper Fraction.

The Rule is.

Multiply the Integer Part (or whole Number) by the Denominator of the Fraction [Vide Chap. 1. Defin. 31.] and to the Product add the Numerator, and that Sum place over the Denominator for a new Numerator, so this new Fraction shall be equal to the mixt Number given. As for Example.

1. Reduce 18 \(\frac{1}{2}\) into an improper Fraction, multiply the whole Number 18 by 7 the Denominator, and to the Product add the Numerator 3, the Sum is 129, which put over the Denominator 7, and it makes \(\frac{1}{2}\) for the

Answer as followeth.

2. Reduce 147 to a mixt Number, Facit 23111. 3. Reduce 25 576 to a mixt Number, Facit 114.11.

IV. To reduce a Fraction into its lowest Terms equivalent to the Fraction given.

The Rule is, 1. If the Numerator and Denominator and even Numbers, take half the one and half of the other, a often as may be, and when either of them falls out to be at oddNumber, then divide them by any Number that you can discover, will divide both Numerator and Denominator without any Remainder; and when you have thus proceed ed as low as you can reduce them, then this new Fraction fo found out, shall be the Fraction you defire, and will be in Value to the given Fraction.

Example 1. Let it be required to reduce 191 into in

lowest Terms. First I take

140

the Half of the Numera- 129 96 48 24 12 4 tor 192, and it is 96, then 336 168 84 42 21 7

Half of the Denominator.

and it is 168, so that it is brought to - 2x, and next to 10 and by halfing still, to 24 and their half is 12, and now! can no longer half it, because 21 is an odd Number, where fore I try to divide them by 3, 4, 5, 6, &c. and I find; divides them both without any Remainder, and brings them 4, as per Margent.

So I conclude 4, thus found to be equal in Value to the

given Fraction 122

What is ½ 36/4 in its lowest Terms? Ans. 7/8.
 What is ½ 86/4 in its lowest Terms? Ans. ½3/46

The best Way to reduce a Fraction into its lowest Terms, is, by finding a common Measurer, viz. the greatest Number that will divide the Numerator and Denominator without any Remainder, and by that Means reduce a Fraction to is lowest Terms at the first Work; and to find out this com mon Measurer, divide the Denominator by the Numerator, and if any thing remain, divide your Divisor thereby; and if any thing yet remain, then divide your last Divisor by 4 do so until you find nothing remaining: Then this last De visor shall be your greatest common Measurer, which will divide both Numerator and Denominator, and reduce then both into their lowest Terms at one Work.

Example 4. Reduce $\frac{23}{3}$ into its lowest Terms by a common Measurer; to Effect which, I divide the Denominator 304 by the Numerator 228, and there remains 76, then I divide 228 (the first Divisor) by 76 (the Remainder) and it quotes 3, and nothing remains; wherefore the last Divisor 76 is the common Measurer; by which I divide the Numerator of the given Fraction, viz. 228 it quotes 3 for a new Numerator, then I divide the Denominator 304 by 76, and it quotes 4 for a new Denominator, so that now I have sound 34 equal $\frac{23}{3}$.

5. Reduce 7048 into its lowest Terms by a common

Measurer, Facit, 11.

hem Ex 6. Reduce 200 % into its lowest Terms by a common Measurer, Facit, 18.

A Compendium.

Note, That if the Numerator or Denominator of a Fraction, end each with a Cypher or Cyphers, then cut off as many Cyphers from the one as from the other, and the remaining Figures will be a Fraction of the same Value, viz. 1400 will be found to be reduced to \frac{1}{2}\frac{4}{4}, by cutting off the two Cyphers from the Numerator and Denominator with a Dash of the Pen thus, \frac{3}{4}\frac{1}{2}\frac{0}{2}, and \frac{4}{7}\frac{0}{2}\frac{0}{2} will be \frac{4}{7}\frac{0}{2}, thus,

V. To find the Value of a Fraction in the known Parts of Coin, Weights, &c.

The Rule is, Multiply the Numerator by the Parts of the next inferior Denomination that are equal to an Unit of the same Denomination with the Fraction; then divide that Product by the Denominator, and the Quote gives you its Value in the same Parts you multiply'd by, and if any Thing remain, multiply it by the Parts of the next inferior Denomination, and divide as before; do so till you can bring it no lower, and the several Quotients, will give you the Value of the Fraction as was required; and if any at last remain, place it for a Numerator over the sormer Denominator. Some sew Examples will make the Rule plain.

142 R	edut	tion of		Chap. 19

So

And so likewise you may find the Value of any Fraction, either in Weight or Time, &c.

V1. To reduce a Compound Fraction to a Simple of the same Value.

What a Compound Fraction is, hath been flewn in Chap. 1. Definition 24, and to reduce it to a Simple Fraction of the same Value.

The Rule is, Multiply the Numerators continually, and place the last Product for a new Numerator, then multiply the Denominators continually, and place the last Product for a new Denominator. So this fingle Fraction shall be equal to the compound Fraction. Example,

1. Reduce ; of ; of ; to a simple Fraction.

Multiply the Numerators 2, 3, and 5 together, they make 30 for a new Numerator; then I multiply the Denominators 3, 5, and 8 together, and their Product is 120 for a Denominator, fo the simple Fraction is $\frac{3}{120}$, and cutting off the Cyphers, it is $\frac{3}{12}$, equal to $\frac{3}{4}$ by the 4th Rule following.

5	3 2
15	6
8	5

Facit -10, or -1, or 1.

2. What is $\frac{7}{7}$ of $\frac{6}{9}$ of $\frac{4}{7}$ of $\frac{11}{12}$? Answer $\frac{7}{7}$; $\frac{4}{9}$, or $\frac{14}{7}$; or $\frac{2}{7}$; in its lowest Terms.

3. What is 1! of 13 of 20? Answer 4872.

By this you may know how to find the Value of a compound Fraction, viz. First reduce it to a Simple one, and then find out his Value by the 5th Rule foregoing.

Example 4. What is the Value of 1, of 2, of 12 of a

Pound? Answer 11s. 3 d.

VII. To reduce Fractions of unequal Denominations to Fractions of the same Value, having equal Denominators.

The Rule is, Multiply all the Denominators together, and the Product shall be the common Denominator. Then multiply each Numerator into all the Denominators, except its own, and the last Product put for a Numerator over the Denominator, found out as before: So this new Fraction is equal to that Fraction whose Numerator you multiply into the said Denominator. Do so by all the Numerators given, and you have your Desire.

Example] 1. Reduce $\frac{1}{3}$ $\frac{4}{5}$ and $\frac{7}{3}$ to a common Denominator. Multiply the Denominators 4, 5, 6, and 8 together continually, and put the Products 960 for the common Denominator; then multiply the Numerator 3 into the Denominators 5, 6, and 8, and the Product is 720, which is a Numerator to 960 (found as before) fo $\frac{7}{3}$ is equal to the first Fraction $\frac{3}{4}$; then I proceed to find a

Desw

 q_i $1 \frac{21}{2}$ etion,

1. 11

Same

rn in Fra-

tiply duct ill be

L

Product is \$300 equal to \$1. Then multiply the Numerator 7 into the Donominators 4, 5, and 6, the Product is \$440.

equal to 7, and the Work is done; so that for 345 and 2

I have $\frac{730}{360} \frac{668}{760} \frac{800}{960}$ and $\frac{840}{960}$.

2. Reduce 11, 14, and 19 in a common Denominator, faciunt, $\frac{1311}{3796}$, $\frac{1775}{6786}$, and $\frac{1314}{5796}$.

VIII. To reduce a Fraction of one Denomination to another.

when a Fraction of a smaller is brought to a greater Denomination; Descending, when a Fraction of a greater Denomination of a greater Denomination.

mination is brought lower.

2. When a Fraction is to be brought from a leffer to a greater Denomination, then make of it a Compound Fraction, by comparing it with the intermediate Denominations between it, and that you would have it reduced to then (by the 6th Rule foregoing) reduce your Compound to a fingle Fraction, and the Work is done. Example.

Quest. 1. It is required to know what Part of a Pound

Sterling 5 of a Penny is?

To resolve this, I consider that 1 d. is 1 of a Shilling, and a Shilling is 1 of a Pound; wherefore 7 d. is 7 of 1 of 2 of a Pound, which by the said 6th Rule I find tobe 155 of a Pound Sterl. of English Money.

Quest. 2. What Part of a Pound Trey-weight is \(\frac{4}{3} \) of a Penny-weight? Auf. \(\frac{4}{3} \) of \(\frac{1}{2} \), equal to \(\frac{1}{2} \) \(\frac{4}{3} \) Trey.

3. When a Fraction is to be brought from a greater to a lefter Denomination, then multiply the Numerator by the Parts contained in the several Denominations betwixt it, and the Parts you would reduce it to ; then place the last Product over the Denomination of the given Fraction. Exam.

Quest. 3. I would reduce $\frac{1}{3}l$. to the Fraction of 1 d. to do which, I multiply the Numerator 3 by 20 and 12, the Product is 720, which I put over the Denominator 5, it makes $\frac{7}{3}$ of 1 d. equal to $\frac{1}{3}l$.

Quest. 4. What Part of an Ounce Trey is $\frac{4}{12}$? Answer, C H A P.

CHAP. XX.

Addition of Vulgar Fractions.

I. IF your Fractions to be added have a common Den minator, then add all the Numerators together, and place their Sum for a Numerator to the common Denominator, which new Fraction is the Sum of all the given Fractions; and if it be improper, reduce it to a whole or mine Number, by the 3d Rule in the 29th Chapter.

Quest. 1. What is the Sum of 17, 24, 14, and 14?

The Denominators are equal, viz. every one is 24, wherefore add the Numerators together, viz. 7, 9, 16, and 14, their Sum is 46, which put over the Denominator 24, it makes 14 the Sum of the given Fractions, which will be reduced to the mixt Numbers 1 12, or 1 11.

2. But if the Fractions to be added have unequal Denominators, then reduce them to a common Denominator by the 7th Rule of Chapter 19, and then add the Numerators together, and put the Sum over the common Denomi-

hator, Gc. as before in the last Example.

Quest. 2. What is the Sum of 3, 7, 12, and 11;

Queft. 3. What is the Sum of 17, 4, and 17?

Answer. 13 55.

3. If you are to aid mixt Numbes together, then add the Fractional I arts as before, and if their Sum be an improper Fraction, reduce it to a mixt Number, and add its integral Part to the integral Parts of the given mixt Numbers, and the Work is done.

Queft. 4. What is the Sum of 131 and 245?

First add the Fractions \(\frac{1}{4} \) and \(\frac{1}{5} \), the Sum is \(\frac{1}{2} \), then add the Integer I to I3 and 24, their Sum is 38, and put after it the Fraction \(\frac{1}{2} \) it is 3 \(\frac{1}{2} \) for the Answer, or it is 38\(\frac{1}{2} \).

Quest. 5. What is the Sum of 483, 645, and 134?

Facit 243 14, or 24345.

4. If any of the Fractions to be added, is a Compound Fraction, it must first be reduced to a Simple Fraction by

the fixth Rule of Chapter 19, and then add it to the relb according to the second Rule of this Chapter. Example.

Reduce $\frac{7}{8}$ of $\frac{3}{4}$ of $\frac{3}{8}$ into a fimple Fraction, and it is $\frac{10}{5}$, which reduced with the other two, and added, and $\frac{10}{5}$, $\frac{3}{8}$.

Quest. 7. What is the Sum of 11 and 4 of 4 of 5?

Answer I, 1.

5. If the Fractions to be added are not of one Denomination, they must be so reduced, and then proceed as before.

Quest. 8. What is the Sum of \frac{1}{4} 1. and \frac{5}{5} s.

Of the given Fractions here, one is of a Pound, and the other the Fraction of a Shilling; and before you can add them together, you must reduce § s. to the Fraction of a Pound as the other is (by the 8th Rule of Chap. 19.) and it makes 125 l. then \(\frac{1}{4} \) and 125 l. will be found to be \(\frac{1}{2} \) l. by the 7th Rule of Chap. 19. and in its lower

Terms 191. by the 4th Rule of Chap. 19.

It would have been the same (if by the latter Part of the 8th Rule of Chapter 19.) you had reduced \(\frac{3}{4}\) l. to the Fraction of a Shilling, which you would have found to have been \(\frac{6}{3}\)s. which added to \(\frac{6}{6}\)s. by the said 17th Rule of the last Chapter, the Sum is 15 s. \(\frac{1}{24}\), which is equal to the Sum sound, as before, viz. \(\frac{1}{24}\) l. for (by the 5th Rule of Chapter 19.) the Value of \(\frac{1}{24}\) l. will be found to be 15 s. 10 d. and so will 15 s: \(\frac{1}{24}\) be found to be just as much.

Quest. 9. What is the Sum of $\frac{1}{4}l$. $\frac{3}{5}s$. and $\frac{1}{3}$. $\frac{1}{3}l$?

Ans m, $\frac{3795}{4795}$ or or $\frac{3795}{600}$ l. or in its lowest Terms $\frac{151}{600}$.

CHAP. XXI.

Subtraction of Vulgar Fractions.

Fractions to one Denomination, are here to be observed; for before Subtraction can be made, the Fraction must be reduced to a common Denominator, then subtraction one Numerator for the other, and place the Remains over a common Denominator, which Fraction shall be the

Quest. 1. What is the Difference between \(^{1}_{4}\) and \(^{1}_{8}\)? The given Fractions are reduced to \(^{1}_{30}\), and \(^{2}_{30}\), then subtract the Numerator 20 from the Numerator 21, and there remains 1, which being put over the Denominator 28, makes \(^{1}_{3}\) for the Answer or Difference between \(^{2}_{4}\) and \(^{5}_{8}\).

Quest. 2. What is the Difference between and \{ of \frac{1}{4}? Reduce the Compound Fraction \{ of \{ to a fimple Fraction, then proceed as before, and the Answer is \frac{1}{4}? equal

10 11

2. When a Fraction is given to be subtracted from a whole Number, subtract the Numerator from the Denominator, and put the Remainder for a Numerator to the given Denominator, and subtract an Unit (for that you borrowed) for the whole Number, and the Remainder place before the Fraction sound, as before, which mixed Number is the Remainder or Difference sought. Example.

. Quest. 3. Subtract , 7 from 48?

Answer, 37 73; for if you subtract of (the Numerator) from 10 (the Denominator) there remains 3, which put owir is 10 73, and 1 (I borrowed) from 48 rests 47, to which join 13, and it makes 47 73 for the Excess.

Queft. 4. Subtract 18 from 57, remain 56 5.

3. If it be required to subtract a Fraction from a mixt Number, or one mixt Number from another, reduce the fractions to a common Denominator, and if the Fraction to be subtracted be lesser than the other, then subtract the esser Numerator from the greater, and that is a Numerator or the common Denominator; then subtract the lesser integral Part from the greater, and the Remainder with the emaining Fractions thereunto annexed, is the Dissernce equired between the two given mixt Numbers. Example.

Quest. 5. Subtract 25 ; from 54 3. ..

First, Subtract \(\frac{1}{7}\), viz. \(\frac{1}{41}\) from \(\frac{1}{7}\), viz. \(\frac{1}{41}\), the Remainder is \(\frac{1}{7}\), then 20\(\frac{1}{7}\) from 54, remaineth 28, to which

nnex 18 it makes 28 48 for the Answer.

4. But if the Fraction to be subtracted is greater than he Fraction from whence you subtract, then having first duced the Fractions to a common Denominator, take the sumerator of the greatest Fraction out of the Denominator,

he ob an etion

btradi ainder be the

Er

given

and

and add the Remainder to the Numerator of the leffer Frae tion, and their Sum is a new Numerator to the common Denominator, which Fraction Note, then (for the one you borrowed) add one to the integral Part to be subtracted, and fubtract it from the greater Number, and to the Remainder annex the Fraction you noted before, so this new mixt Number shall be the Difference fought. Example.

Queft. 6. Subtract 143 from 294.

The Fraction, reduced are, viz. 3 equal to 28, and 6 equal to 18, now I should subtract 11 from 18, but lannot, therefore I subtract 21 from 28, rest 7, which added to 16 (the leffer Numerator) make 23 for a Numerator to 25, viz. 23; then I come to the integral Parts 14 and 19. and fay, I that I borrowed and 14 is 15. which taken from 29, there rests 14, to which annexing 28 it is 1423, further Remainder or Difference between 143 and 294.

Queft. 7. Subtract 36 72 from 744? Facit, 37 42.

CHAP. XXII.

Multiplication of Vulgar Fractions.

J. TF the Multiplicand and Multiplier are simple Frati ons, then multiply the Numerators together for new Numerator, and the Denominators for a new Deno minator, and the new Fraction is the Product required.

Quest. 1. What is the Product of 5 by -? ? Facit 45 for the Numerators 5 and 9 being multiply'd, make 45, and the Denominators 7 and 11 being multiply'd make 77.

Quest. 2. What is the Product of 18 by 37? Facit; 2. If the Fractions to be multiplied be mixt Numbers reduce them to improper Fractions by the first Rule of the 19th Chapter; then proceed as before.

Quest. 3. What is the Product of 28% by 13%? The given mixt Numbers being reduced to imprope Fractions are 48 3 equal to 243, and 135 equal to 13, m ad anultiplied by according to the first Rule of

Chapter, produceth = 1019, or 67219.

Queft. 4. What is the Product of 43016 by 18 3? In 55514, or 703 74.

3. If a Compound Fraction is to be multiplied by a 50

du

pu pl

D di

in

th

ple Fraction, first reduce the Compound Fraction into a Simple Fraction, then multiply the one by the other, as is taught above.

Quest. 5. What is the Product of 16 by 3 of 5 of 5?

The Compound Froction 3 of 5 of 4 reduced is 50, or 19 which multiply by 17 produceth 284, which in its low-

eft ferm is 16 for the Answer.

And if the Multiplicand and Multiplier are both Compound Fractions, reduce them both to simple ones, then multiply these sew Fractions as before, so you have the Product.

Quest. 6. What is the Product of \$ of \$ of \$?

Asswer. 718 in its lowest Term 18.

Quelt. 7. What is the Product of ? of 4 by ? of ??

Answer. 360, or 36, or in its least Terms ;

4. If a Fraction be to be multiplied by a whole Number, put under the given whole Number an Unit for a Denomitor, whereby it will be an improper Fraction, then multiply the Fractions as before. Example.

Quest. 8. What is the Product of 24 by ??

Answer. 48, for 24 by putting an Unit under it, will be 14, and 24 by 2 produceth 48 or 16.

Queft, 9. What is the Product of 36 by 1??

Answer. 3 24 or 29 11.

CHAP. XXIII.

Division of Vulgar Fractions.

1. If the Dividend and the Divisor are both sample Fractions, then multiply the Numerator of the Dividend into the Denominator of the Divisor, and the Product is a new Numerator, and multiply the Denominator of the Dividend into the Numerator of the Divisor, and the Product is a new Denominator, which new Fraction thus found, is the Quotient you desire. Example.

Quest. 1. What is the Quotient of & divided by 3;?

Anj. 24, or 124, for the first I multiply (5) the Numerator of the Dividend 3 into (5) the Denominator of the Divisor, and the Product (25) is a Numerator for the Quotient, then I multiply (8) the H 3 De-

P

Denominator of the Dividend, into (3) the Numerator cost the Divisor, and the Product (24) I put in the Quotient for a Denominator, so I find 14 is the Quotient sought.

Queft. 2. What is the Quotient of 1 divided by 3?

Answ. 3º equal to 7 in its lower Terms.

2. But if you will divide a fimple Fraction by a Compound, or a Compound by a Simple, first reduce such Compound to a simple Fraction, then go on as before.

Quest. 3. What is the Quotient of $\frac{3}{12}$ divided by $\frac{3}{4}$ of $\frac{3}{12}$.

Answer $\frac{3}{12}$ or $\frac{3}{12}$ first reduce $\frac{3}{12}$ of $\frac{3}{12}$ into a simple Fraction, and it is $\frac{3}{12}$ by which $\frac{3}{12}$ being divided, the Quotient is $\frac{3}{12}$ equal in its least Terms to $\frac{3}{12}$, and if the Divided and Divisor be both of Compound Fractions, reduce them both to a simple Fraction, then divide the one by the other, as in Rule 1. foregoing.

Quest. 4. What is the Quote of \(\frac{1}{3} \) in its lowest Terms.

3. If the Dividend, or Divisor, or both, are mixed Numbers, reduce them to improper Fractions, and perform Division as you are taught before.

Quest. 5. What is the Quote of 12 \(\frac{3}{4}\) divided by \(21\frac{4}{5}\)?

Answer \(\frac{2}{3}\) \(\frac{5}{3}\) for 12 \(\frac{1}{4}\) is equal to \(\frac{1}{4}\), and \(21\) \(\frac{4}{3}\) is equal to \(\frac{1}{3}\), and the Quote of \(\frac{1}{3}\) divided by \(\frac{1}{3}\), is as before

4. If you divide a Fraction by a whole Number, or a whole Number by a Fraction, make the whole Number an improper Fraction, by putting an Unit for a Denominator, to it, as was taught in Rule 4. Chap, 22, and then perform Division as was before taught.

Example.

Quest. 6. What is the Quote of 8 divided by \(\frac{3}{3}\)?

Answer \(\frac{4}{3}\), which is equal to

13.\(\frac{1}{2}\), being reduced as is before directed. See the Work-in the Margent.

3 \(\frac{8}{40}\)

- or 13\(\frac{1}{3}\).

Quest. 7. What is the Quotient of 3 divided by 8?

Answer = 2 as per Margent.

 $\frac{8}{1}$ $\frac{3}{5}$ $\left(\frac{3}{40}\right)$

CHAP. XXIV.

The Rule of Three Direct in Vulgar Fractions.

1. A S in the Rule of Three in Whole Numbers, so likewise in Fractions, you must see that the Fractions of the first and third Places be of the same Denomination.

2. If any of the given Fractions be compound, let them

be reduced to simple of the same Value.

3. If there are given mixed Numbers, reduce them to

improper Fractions by the first Rule of Chap. XIX.

4. If any of the three Terms is a whole Number, make it an improper Fraction by constituting an Unit for its Denominator.

Having reduced your Fraction as is directed in the 4 last Rules, then proceed to a Resolution, which is performed the same Way as in whole Numbers, Respect being had to the Rules delivered for the working of Fractions, viz. Multiply the 2d and 3d Fractions together, according to the first Rule of Chap. XXII. and divide the Product by the first Fraction, according to the first Rule of Chap. XXIII. and the Quotient is the Answer.

Or, (which is better)

5. Multiply the Numerator of the first Fraction into the Denominator of the second and third, and the Product is a new Denominator; then multiply the Denominator of the first Fraction into the Numerator of the 2d and 3d, and the Product is a new Numerator, which new Fraction is the 4th Proportional or Answer, which (if it be an improper Fraction) must be reduced to a whole or mixed Number by the 3d Rule of Chap. XIX. Example.

Quest. 1. If ? Yards of Cloth coft & 1. what will 7 ? Yards

cost ?

Having placed the given Fractions according to the 6th Rule of Chap. X. I proceed to the Resolution, and first I multiply the Numerator of the first Fraction (3) into 8 and 10, the Denominators of the second and third Fractions, and the Product is 240 for a Denominator; then

Quest. 13. If 15 1. of Gold is worth 6151. Sterling what is a Grain worth at that rate?

Answer, 1;d.

Quest. 14. If \(\frac{1}{4}\) Yards of Silk is worth \(\frac{1}{4}\) of \(\frac{1}{6}\) I. what is the Price of 15\(\frac{2}{6}\) Ells Hemish?

Ausmer. 9 1. 12 s. 6 d.

Quest. 15. If ; of 3 of a Pound of Cloves cost 6 s. 27 d. what cost the C. weight at that rate?

Answer. 69 1.6 s. 8 d.

Note, That when the Answer to the Question in this and the next Chapter are given in Fractions, they are given in their lowest Terms.

CHAP. XXV.

The Rule of Three Inverse in Fractions.

I. It hath been already taught (in the 3d Rule of the 11th Chapter) how to discover when the 4th proportional Number (to the three given numbers) is to be found out by a Rule of Three Direct, and when by a Rule of Three Inverse; to which Rule the Learner is now referred.

2. When (in Fractions) you find a Question to be resolved by the Rule of Three Inverse, viz. when the third Term is the Divisor, then having reduced the Terms exactly (according to the Rules in Chap. 24.) multiply the Numerators of the three Fractions into the Denominators of the 2d and 1st Fractions, and the Product is a new Denominator; then multiply the Denominator of the 3d Fraction into the Numerators of the 2d and 1st fractions, and the Product is a new Numerator, which new Fraction thus sound, is the Answer to the Question.

Quift.

The Rule of Three, &c. Chap. 25

Quest. 1. If \(\frac{1}{4}\) of a Yard of Cloth that is two Yards wide, will make a Garment, how much of any other Drapery that is \(\frac{1}{2}\) of a Yard wide will make the same Garment?

Answer 2 ! Yards.

Quest. 2. I lent my Friend 46 1. for 4 of a Year, how much ought he to lend me for 12 Parts of a Year?

Answer 633 1.

Quest. 3. If 3 of a Yard of Cloth that is 21 Yards wide will make any Garment, what Breadth is that Cloth when 12 Yard will make the same Garment?

Answer 50 of a Yard wide.

Quest. 4. How many Inches in Length of a Board that is 9 Inches broad, will make a Foot Square?

Answer, 16 Inches in Length.

Penny-loaf weighed 10 \(\frac{2}{3}\) Ounces, what will it weigh when the Bushel cost 8 s. \(\frac{2}{3}\)?

Answer, 5 18; Ounces.

Quest. 6. If 17 Men can mow 24 \(\frac{1}{2}\) Acres in 10\(\frac{2}{3}\) Days, in how many Days will fix Men do the same?

Answer, In 21 ! Days.

CHAP. XXVI.

Rules of Practice.

1. IN the fingle Rule of Three, when the first of the 3 Numbers in the Question (after they are disposed according to the fixth Rule of Chapter 10,) happened to be an Unit (or 1) that Question many Times may be resolved far more speedily than by the Rule of Three, which kind of Operation is commonly called Paradice, and indeed it is of excellent Use among Merehants, Tradesmen, and others, by Reason of its Speediness in finding a Resolution to such Kind of Questions.

2. The chiefest Questions resolvable by these brief Rules, may be comprehended under the three general Heads or

Cates fullowing, viz.

When

8. When the given Price of the Integer, is a Part r Parts of a Shilling, (viz. Pence) divide the given lumber of Integers, (whose Value is sought) by the Denominator of the Fraction, representing the even Part, and the Quote is Shillings (always minding the 7th Rule

Rule of the 9th Chapter) and those Shillings may be reduced into Pounds by the third Rule of this Chapter. Example: Let it be required to find the Value of 438 1. at 34 per 1. I confider 3 d. is + of a Shilling, and 4381. will cost fo many 3 Pences, wherefore I divide 438 by 4 the Denominator or 1, and the Quote is 109 Shillings, and two remains, which is two 3 d. or 6 d. the whole Value is 5 h 9 s. 6 d. as by the following Work appeareth.

If the Learner is minded to try the Fruitfulness of his Genius, he may frame as many Examples as he thinks fit

and work them as before. 9. If the Price of the Integer be Pence under 12, and

yet not an even Part, then it may be divided into even Parts, and so the Parts of the given Numbers taken as cordingly, and added together, as if it were 5 d. which is 3 d. and 2 d. viz, + and + of a Shilling, first take +d the given Number, and then thereof, and add them to gether, and their Sum is the Answer in Shillings, still ob ferving Rule 7 of Chapter 9, for the Remainder, (if any be) then bring the Shillings into Pounds by the third Rule foregoing. Likewise 7 d. is 1 and 1, so 9 d. is 1 and 1 and 10 d. is \frac{1}{2} and \frac{1}{3}, and 11 d. is \frac{1}{4} and \frac{2}{3} of a Shilling or elfe many Times your work may be shortned thus, va when the faid given Price is to be divided into even Parts of a Shilling, or of a Pound, after you have taken the first even Part, the other may be an even Part of that Part, a in the next Example, where are given 439 1. at 5 d. per l now I may divide it thus, viz. into 4 d. and 1 d. and 4d heing 1 of a Shilling, and I d. being 1 of 4 d. I first take 1 of 439 1. and it gives 146 s. 4 d. and for the 1 d. I tale of 145 s. 4 d. which is 36 s. 7 d. which in all comes t 91. 25. 11 d. Examples follow.

14.

or th

Num

Exam

are 18 1. 1 s. 5 d. 2 grs. as by the Margent.

Cale 4.

11. When the Price of the Integer is 2 s. then cut off the Figure in the Place of Units of the given Number, and do ble it for Shillings, and the Figures on the other Handa Pounds. Example, 436 Yards at 2 s. per Yard, cut off the last Figure 6, and double it, makes 43 6 12 s, and the other two Figures, viz. 43, are fo many Pounds; to that their Value is 43 1. 12 s. 431,124

as per Margent.

12. Hence it is evident that when the given Price of Integer is an even Number of Shillings, then if you tak half of that (even) Number of Shillings, and multiply th given Number of Integers thereby, doubling the first ! gure of the Product, and fetting it apart for Shillings, the rest of the I roduct will be Pounds, which Pounds an Shillings are the Value fought. Example. What co 536 Yards at 8 s. per Yard ? To retolve which, I take Half of 8 s. (the Price of a Yard) which is 4, and mu tiply 536 thereby, fasing, 4 Times 6 is 24, then I double the first Figure 4 makes 8 5367ds at 8

for shillings, and carry 2 to the next Product, Gc. ! find the rest of the Product to be 214 which I note for Pounds; fo that the

Value of 536 Yards at 8 s. pr Yard, is 2141.8 s. as by the Margent. Other Examples of the fame Kind may be wrought after the fame Manner.

13. If the given Price of the Integer is an odd Num ber of Shillings, then work first for the even Number

15.

214 1. 85

Pence vide feck that (384 y

8 d. the C lo tha

amou fervir 16

of Shillings by the last Rule, and for the odd Shilling ake, of the given Number of Integers, according to the 3d Rule of this Chapter, and add them together, and you have your Desire. Examples follow.

Yds s.	Ells s.
422 at 3 per Yard	431 at 13
1. s.	l. s.

25 16	16 04
180 12 Facit	275 08 Facit
14. Except when the gi	ven Price of the Integer

14. Except when the given Price of the Integer is 5 s. or then it is sooner answered by taking \(\frac{1}{4} \) of the given Number, whose Value is sought, as in the following

Example.

Pence, or Shillings, Pence and Farthings; then divide the given Number of Integers whose Value you seek by the Denominator of that Fraction representing that even Part. As for Example, What is the Price of 384 yards at 6 s. 8 d. per yard? Here I consider that 6 s. 8 d. is † of a Pound, wherefore divide 384 by 3, and the Quote is the Answer, viz. 128 1.

fo that 384 yards at 6 s. 8 d. per yard, amounts to 1281. as per Margent, still observing the 7th Rule of the 9th Chapter.

16. When the given Value of the Integer is Shillings

and Pence, and not an even Part of a Pound, yet many times it may be divided into Parts, (viz. 6 s. 6 d. is 4 s. and 2 s. 6 d.) for the 4 s. Work according to the rath Rule foregoing, and for the 2 s. 6 d. take the eighth Part of the given Number, and add them together, then their Sum is the Value required.

So 8 s. 6 d. will be divided into 6 s. and 2 s. 6 d. and the Price of the given Number may be found out as before

Gc. Examples follow.

	yds. s. d. 3% at 8 8	s.	Ells s. d. 240 at 5 4
1 1 0	128 L 13 4 38 12 0	2	54 0

22. When there is given the Value of an Integer, and it is required to know the Value of many fuch Integers together, with a or i or an Integer, the first (by the former Rules) find out the Value of the given Number of Integers, and then for a of an Integer take a of the given Value of the Integer, or for a take of the given Value of the Integer, and for

first take the Half of the given Value, and then Half of the Half, setting each Part under the Precedent, then adding them together, their Sum will be the required Valued the Integers and their Parts. Example, What is the Va lue of 116 Yards, at 4 s. 6 d. per Yard? To give an An fiver, First I work for the Value of 116 Yards, by the 5th Rule foregoing, and then for the half Yards, I take half of 4. s. 6 d. which is 2 s. 3 d. and add to the rest found as before, then is that Sum the total Value of 116! yards at 4 s. 6 d. per Yard, which I find to amount to 26 1. 4 s. 3 d. as by the Work in the Margent. And all other Examples of this Kind, are wrought the fam

Way. Many more Questions may be stated, and several other Rules of Practice may be shewn according to the Method of diverse Authors; but what have been delivered her are sufficient for the Iractical Arithmetician in all Cass

whatfoever.

C H A P. XXVII.

The Rule of Barter.

1. D Arter is a Rule among Merchants, which (in the Exchange of one Commodity for another) informs them fo to proportion their Rates, as that neither may ful tain Lois.

2. To refolve Questions in Barter, will not be difficult to him that is acquainted with the Golden Rule, or Rule of Three, it being altogether used in resolving such Quel tions.

Quest. I. Two Merchants, (viz. A and B) Barter, A hath 13 C. 3 grs. 14 1. of Pepper, at 2 1. 16 s. per C. and B hath Cotton at 9 d. per l. I demand how much B mul give A for his Pepper?

Answer 9 C. 1 gr.

First find by the Rule of Three, or the Rules of Pra-Aice foregoing, how much the Pepper is worth, faying,

yds. 116; at 4 11 1. 125.

Chap. 27. Barter. If 1 C. coft 21. 16 s. what will 13 C. 3 grs. 141. coft? that Answer 38 1. 17 s. Secondly, By the Rule of Three, say, If 9 d. buy 1 l. of ding ie d Cotton how much will 38 1. 17 s. buy? Answer. 54 C. and so much Cotton must B give to A for 3 C. 3 grs. 14 l. of Pepper, at 2 l. 16 s. per Cent. when he Cotton is worth 9 d. per 1. Quest. 2. A and B Barter, A hath 120 Yards of broad Cloth, worth 6 s. per Yard, but in the Barter he will have s. per Yard; Bhath Shalloon worth 4 s. per Yard. Now I demand how many Yards of Shalloon B must give A for his Broad-cloth, making his Gain in Barter equal to that of A? Answer 110 Yards of Shalloon. First (as in the last Question) find out how Bought to ell his Shalloon in Barter, v z. fay, If 6 s. require 8 s. what will 4 s. require? Answer 5 s. 4 d. Thus you fee that B must sell his Shalloon in Barter at Thus you see that B mult let all 8 s. per Yard.

s. 4 d. if A sell his Broad-cloth at 8 s. per Yard. It remaineth now to find out how much Shalloon B must ive for 120 Yards of Broad-cloth, which refolved after he Method in the first Question of this Chapter is found o be 180, and so many Yards of Shalloon must B give A or the 100 Yards of Broad-cloth. Quest. 3. A and B bartered, A had 14 C. of Sugar worth 6 d. per 1. for which B gave him I C. 3 grs. of Cindamon. I demand how B rated his Cinnamon per 1. Ansmer 4 s. per 1. Quest. 4. A and B Barter, A hath 4 Tun of Brandy, worth 37 1. 16 s. ready Money, but in Barter he hath 501. s. per Tun, and giveth B 21 C. 2 grs. 11 & l. of Ginger or the 4 Tun of Brandy, I defire to know how much B old his Ginger in Barter per C. and how much it is worth n ready Money? Anywer For 9 1. 6 s. 8 d. in Barter, and it is worth 7 1. A er Cent. in ready Money.

Quest. 5. A and B Barter, A hath 320 Dozen of Cand-. es, at 4 s. 6 d. per Dozen, for which B giveth him 30 l. in Money, and the rest in Cotton at 8 d. per 1. I demand how

CHAP

much Cotton he must give him more than 30 1.

CHAP. XXVIII.

Questions in Loss and Gain.

2. I. A Merchant bought 436 Yards of Broad-cloth & 8 s. 6 d. per Yard, and selleth it again at 10 4 d. per Yard; now I desire to know how much he gain in the 436 Yards?

Answer 391. 12 s. 4 d.

First, Find out by the Rule of Three, or by Practice how much the Cloth cost him at 8 s. 6 d. per Yard, which I find to be 185 l. 6 s. then by the same Rule find out how much he sold it for, viz 225 l. 5 s. 4 d. then subtra 185 l. 6 s. which it cost him, for 225 l. 5 s. 4 d. which he sold it for, and there remaineth, 39 l. 19 s. 4 d. so his Gain in the Sale thereof.

Otherwise, it may sooner be resolved thus, first find a how much he gained per Yard, viz. Subtract 81.61 which he gave per Yard, from 10 s. 4 d. which he sit for per Yard, the Remainder is 1 s. 10 d. for his Ga

per Yard. Then fay,

If one Yard gain 1 s. 10 d. what will 436 Yards gain The Answer, by Practice or the Rule of Three, is 39 19 s. 4 d. as was found before.

Quest. 2. A Draper bought 124 Yards of Holland-clot which he gave 31 l. I defire to know how he must sellitz Yard to gain 101.6 s. 8 d. in the whole Sale of 124 Yard

Answer. At 6 s. 8 d. per Yard.

Add the Price which it cost him, (viz. 31 l.) to his tended Gain, (viz. 10 l. 6 s. 8 d.) the Sum is 41 l. 6 8 d. Then tay,

If 124 Yards require 41 1.6 s. 8 d. what will 1 Yds quire? By the Rule of Three, I find the Answer 6 s. 8

Quest. 3. A Grocer bought 3 C. 1 qr. 14 l. of Close which cost him 2 s. 4 d. per 1. and fold them for 52 l. 14 1 defire to know how much he gained in the Whole?

Answer 8 1. 12 s.

Muest. 4. A Draper bought 86 Kerseys for 1291. Id mand how he must sell them per Piece to gain 15 1. in h ing out 100 1. at that rate? Answer 11. 14 s. 6 d. 1 Piece; for, As 100 is to 115 1. fo is 129 1. to 148 1. 7 3.

So that by the Proportion above, I have found how uch he must receive for the 86 Kerseys, to gain after e Rate of 15 per C. Then to find how he must fell them r Piece, I fay,

As 86 Pieces are to 148 1. 7 s. fo is one Piece to 1 1. 4s.

d. which is the Number fought.

Quest. 5. A Grocer bought 44 C. of Pepper for 15 1. 7 s. 4 d. and it proving to be damnified) is willing to fe 12 1. 10 s. per Cent. I demand how he must fell it 11?

Answer. 7 d. per 1.

Subtract 12 1. 10 s. the Lofs of 1001. from 100 1.

d there remains 87 1. 10 s. Then fay,

As 100 1. is to 87 1. 10 s. fo is 15 1. 17 s. 4 d. to 1. 17 s. 8 d. and fo much he muk fell it all for, to fe after the Rate propounded : Then to know how he ust sell it per 1. I say,

As 13 1. 17 s. 6 d. is to 4 1 C, fo is I 1, to 7 d.

Quest. 6. A Plummer fold 10 Fodder of Lead (the odder containing 19 - C.) for 204 1. 10 s. and gained ain ter the Rate of 12 1. 1 ter the Rate of 12 1. 10 s. per 100 l. I demand how

Answer. 18 s. 8 d.

To refolve this Queltion, add 12 1. 10 s. (the Gain per of ant.) to 10 1. and it makes 112 1. 10 s. Then fay,

As 112 1. 10 s. is to 100 1. fo is 204 1. 15 s, to 182 1. hich 182 1. is the Sum it cost him in all; then reduce ur 10 Fodders to Half Hundreds, and it makes 390.

hen fay,

isi

. 6

di

. 8

ove

14

1 8

nl

As 390 Half Huadreds is to 182 1. fo is 2 Half Huneds to 18 s. 8 d. the Price of two Half Hundreds, or 1

mt, and so much is stood him in per C, wt.

Quest. 7. A Merchant bought eight Tuns of Wine, hich being sophisticated, he selleth for 400 1. and loseth er the Rate of 12 1, in receiving 100 1. Now I demand w much it cost him per Tun, and how he selleth it per illon to lose after the said Rate?

Answer. It cost him 56 1. per Tun, and he must sell it 3 s. 11 d. 19 grs. per Gallon, to lose 12 l. in receiving

01.

comes in for 112 l. laid out; wherefore to find out he

much he laid out for the whole, I fay,

As 100 l. is to 112 l. so is 400 l. to 448 l. and much the 8 Tun costs him: Then to find out how much cost per Tun, I say,

As 8 is to 448 l. fo is 1 to 56 l. the Price it coft h

Tun.

Now to find how he must fell it per Gallon, reduce the

8 Tuns into Gallons, make 2016. Then fay,

As 2016 Gallons is to 400 l, so is I Gallon to 3 at d. 21° qrs. the Price he must sell it at per Gallon lose as aforesaid.

Quest. 8. A Merchant bought 8 Tuns of Wine, who being sophisticated, he is willing to sell for 400 l. and lefth at that Rate 12 l. in laying out 100 l. upon the same now I demand how much it cost him per Tun?

Here I consider that for 100 l. laid out, he received to 88 l. wherefore to find what 8 Tuns cost him, I say,

As 88 l. is to 100 l. fo is 400 l. to 454 The Price all cost him; then to find out how much per Tun, I so As 8 is to 454 The fo is 1 to 56 The or 56 l. 16 s. 4

2 T grs. per Tun.

CHAP. XXIX.

Equation of Payments.

chants, whereby we reduce the Times for Payment of several Sums of Money to an equated Time Payment of the whole Debt, without Damage to Debt or Creditor; and,

The Rule is,

2. Multiply the Sums of each particular Payment by respective Time, then add the several Products togeth and their Sum divide by the total Debt, and the Quoi chence arising is the equated Time, for the Payment of whole Debt. Example.

of 50 and the Payme equate or Cre

Char

Qu

haid a Mont he agi whole

600 200

200

and the whole Paym

rest o

t is dion is In Mont

Mont Mont Chap. 29. Equation of Payments. 17

Quest. 1. A is indebted to B in the Sum of 130 l. where of 50 l. is to be paid at 2 Months, and 50 l. at 4 Months, and the rest at 6 Months, now they agree to make one Payment of the total Sum; the Question is, What is the quated Time for Payment, without Damage to Debtor or Creditor?

To resolve this Question, I multiply each Payment by

ts Time, viz.

by

of

The Sum of the Product is -- 480

Then I divide 480 (the Sum of the Products) by 130 (the total Debt) and the Quotient is 3 7 Months for the

Time of paying the whole Debt.

Quest. 2. A Merchant hath owing him 1000 l. to be paid as followeth, viz. 600 l. at 4 Months, 200 l. at 6 Months, and the rest (which is 200 l.) at 12 Months, and he agreeth with the Debtor to make one Payment of the whole, I demand the Time of Payment without Damage to Debtor or Creditor?

The Sum of the Products is—6000 and the Sum of the Products (6000) being divided by the whole Debt (1000 l.) quotes 6 Months for the Time of

Payment of the whole Debt.

3. The Truth of the Rule is thus manifest, if the Inte-

rest of that Money which is paid by the equated Time (after it is due, be equal to the Proof of the Interest of that Money (which by the the Rule of equated Time) is paid so much sooner than the operation of the is due at any rate per C. then the Operation is true, otherwise not. Example.

In the last Question 600 l. should have been paid at 4 Months, but it is not discharged till 6 Months, (that is 2 Months after it is all due) wherefore its Interest of 2 Months at 6 per Cent. per Annum is 6 l. and then 2 Cl.

1 0

Equation of Payments. Chap. 29, was to be paid at 6 Months, which is the equated Time for its Payment, therefore no Interest is reckoned for it; but 200 l. should have been paid at 12 Months, but is paid at 6 Months, which is 6 Months sooner than it ought, where fore the Interest of 200 l. for 6 Months is 6 l. (accounting 6 l. per Cent. per Annum) which is equal to the Interest of 600 l. for 2 Months, wherefore the Work is right,

Quest. 3. A Merchant hath owing him a certain Summe be discharged at 3 equal Payments, viz. \(\frac{1}{3}\) at two Months, and \(\frac{1}{3}\) at eight Months, the Question is, What is the equated Time for the Payment of the whole Debt?

In Questions of this Nature, (viz. where the Debt is divided into unequal Parts) each of its Parts is to be multiply'd by its Time, and the Sum of the Product is the Answer.

multiply'd by 2 Mon. produceth 7 multiply'd by 4 Mon. produceth 1 multiply'd by 8 Mon. produceth 2

The Sum of the Product is 4 2

which is 4 2 Months for the equated Time of Payment.

If instead of the Fractions representing the Parts, you had wrought by the Numbers themselves (represented by those Parts) according to the first and second Example, it would have been the same Answer; and suppose the Deb had been 90 l. then \frac{1}{3} of it is 30 l. for each Payment, in at 2, 4, and 8 Months. Then,

30 l. multiplied by 2 Mon. produceth 60 30 l. multiplied by 4 mon. produceth 120 30 l. multiply'd by 8 Mon. produceth 240

The Sum of the Product is 420 which divided by 90 (the whole Debt) quoteth 4/28, 4 \(\frac{1}{2}\) Months as before.

Quest. 4. A Interchant oweth a Sum of Money tobe paid $\frac{1}{2}$ at 5 Months, and $\frac{1}{4}$ at 8 Months, and $\frac{1}{4}$ at 1 Months, and he agreeth with his Creditor to make one to tal Payment; I demand the Time without Damage to Do

Cha tor o will

40 l.
viz. 2
quate

where and to for P

paid What Sum

End fent, the lo is agr Chap. 29. Equation of Payments.

173

tor or Creditor? Work as in the last Question, and you

will find the Answer to be 7 Months.

Quest. 5. A is indebted to B 6401. whereof he is to pay 401. present Money, 3501 at 3 Months, and the rest, viz. 2501. at 8 Months, and they agree to make an equated Time for the whole Payment, now I demand the Time?

In Questions of this Nature, (viz. where there is ready Money paid) you are multiplying to neglect the Money that is to be paid present, and work with the rest. as is before directed, and divide the Sum of the Products by the whole Debt, and the Quote is the Answer; for here 40 l. is to be paid present, and hath no Time allowed; and according to the Rule it should be multiplied by its Time, which is 6; therefore 40 Times 0 is 0, which reither augmenteth nor diminisheth the Dividend; wherefore to proceed (according to Direction) I say,

350 by 3 Months, produceth _____ 1050 250 by 8 Months, produceth ____ 2000

The Sum of the Product is 3050 which divided by 640, the whole Debt, the Quote is 422

Months, the Time of Payment.

Quest. 6. A is indebted to B in a certain Sum, half whereof is to be paid present Money, one 3d at 6 Months, and the rest at 8 Months; now I demand the equated Time for Payment of it all?

Answ. 31 Months is the Time of Payment.

Quest. 7. A is indebted to B 120 l. whereof \(\frac{1}{2} \) is to be paid at 3 Months, \(\frac{1}{2} \) at 6 Months, and the rest at 9 Months; What is the equated Time for the Payment of the whole Sum?

Answer. At 6 Months?

Quest. 8. A is indebted to B 420 l. which is due at the End of 6 Months, but A is willing to pay him 140 l. pre-sent, provided he can have the Remainder forborn so much: the longer, to make Satisfaction for his Kindness; which is agreed upon: I desire to know what I ime ought to be ellotted for the Payment of the 280 l. remaining?

The Operation of this Question is left to the Learners to try his Genius; and who, in this Case, must have an Eye to the Rule of Three.

CHAP. XXX.

EXCHANGE.

1. THE Rule of Exchange informeth the Merchants how to exchange Monies, Weights, or Measures of one Country into (or for) the Monies, Weights, or Measures of another Country, and when the Rate, Reason, or Proportion betwixt the Money, Weights or Measures of different Countries is known, it will not be difficult for the Practitioner that is well acquainted with the Rule of Proportion (or Rule of Three) to resolve any Question, where in it is required to exchange a given Quantity of the one Kind into the same Value of another Kind.

2. In Questions of Exchange there is always a Comparison made between the two Coins, Gc. of two Countries

(or Kinds) or of more.

3. In Questions where there is a Comparison made be even two Things, (whether they be Monies, Weights Us.) of different Kinds, there may be a Solution found by a single Rule of Three, as by the foll wing Example.

Quest. 1. A Merchant at L ndon deliver'd 370 l. Ster. to receive the same at Paris in French Crowns, the Exchange 3 & French Crowns per l. Sterling, I demand how

many French Crowns he ought to receive?

In placing the Numbers, observe the 6th Rule of the 1th Chapter, which being done, the given Number will Rand thus:

Crowns

and being reduced according to the Rules of the 12th Chapter, will fland thus:

As riste '4, fois 174 to 1233 1.

So that I conclude he ought to receive 1233 4 French Crowns at Paris for his 370 l. delivered at London.

Flami, to rec ive the Value thereof at Naples in Ducath

So

the ex

the fi a kno Meal

the la giv

at N Bruj

Thr

the

Lon

The Proportion is as followeth.

Ducats.

As 1 is to 14, fo is 187 to 2817 1.

So I find he ought to receive 2817 ! Ducats at Naples

for the 387 1. Flemish delivered at Amsterdam.

Quest. 3. A Merchant at Florence delivereth 2478 Ducatoons, to receive the Value at London in Pence, the Exchange at 53 ; Sterl. per Ducatoon; I demand how much Sterling he ought to receive?

> The Proportion for Resolution is, Duc. Duc. As + is to 10?, fo is 147 to 186073.

which is equal to 775 1. 6; for the Answer.

4. When there is a Comparison made between more than two different Coins, Weights, or Measures, there arifeth ordinarily two different Cases from such a Comparilon.

1. When it is required to know how many Pieces of the first Coin, Weight or Measure, are equal in Value to a known Number of Pieces of the last Coin, Weight or

Measure.

he

ill

th

ch

15,

he

2. When it is required to find out how many Pieces of the last Coin, Weight, or Measure are equal in Value to a given Number of the first fort of Coin, Weight, or Mealure.

An Example of the first Case may be this, viz.

Quest. 4. If 150 Pence at London are equal to 3 Ducate at Naples, and 47 Ducats at Naples make 34 ! Shillings at Bruffels; then how many Pence at London are equal to 139 s. at Bruffels? Facit, 950 d.

The Queftion may be resolved by two single Rules of

Three : For first, I fay,

If | Ducats at Naples make 150 d. at London, how ma-

ny Pence will 3 4 Ducats make? Anf. 240 d.

By the foregoing Proportion we have discovered that 44 Ducats at Naples make 240 Pence at London; and by the Tenor of the Question we see that 47 Ducats at Penice make 35 & Shillings at Bruffels, therefore 240 d. at London are equal to 34. s. at Bruffels, (for the Things that

are equal to one and the same Thing, are also equal to one another) wherefore we have a Way laid open to give a Solution to this Question by another Single Rule of Three, whose Proportion is,

As 34; s. at Brussels is to 240 d. at London, so is 1314 at Brussels to 960 d. at London; which is the Answer w

the Question.

An Example of the second Case may be this, viz.

Quest. 5. It 40 l. Averdupois-weight at London is equal to 36 l. weight at Amsterdam, and 90 l. at Amsterdam makes 116 l. at Dantzick, then how many Pounds at Dantzick, are equal to 122 l. Averdupois-weight at London? Answer, 129 1 l. at Dantzick.

This Question is likewise answered by two single Rule

of Three, viz. FirA, I fay,

As 36 l. at Amsterdam is to 46 l. at London. So is 90 l. at Amsterdam to 100 l. at London.

And by the Question you find that 90 l. at Amsterdam, is 116 l. at Dantzick; and therefore 100 at London is like wife equal thereunto; wherefore again I say,

As 100 l. at London is to 116 l. at Dantzick. So is 112 l. at London to 129 3 l. at Dantzick.

By which I find that 129 1? 1. at Dantzick are equal to

112 Averdupois-weight at London.

s. There is a more speedy Way to resolve such Questions as are contained under the two Cases before mention'd, laid down by Mr. Kersey in the 3d Chapter of his Appendix to Wingate's Arithmetick, where he hash given two Rules for the Resolution of the Questions pertinent to the two said Cases.

6. But I shall lay down a general Rule for the Solution of both Cases; and 1st, Let the Learner observe the solutions Directions in placing of the given Terms, viz.

7. Let these be made two Columns, and in these Coloms so place the given Terms one over the other, as that in the same Column there may not be found two Terms of the same Kind one with the other.

Having thus placed the Terms, the general Rule is, Observe which of the said Columns, hath the most Terms placed in it, and multiply all the Terms therein centinually, and place the last Product for a Dividend; then and Divi

So reper Napi Brug Shill

T:

Sh there Column

D

prod der prod as be

peat 36 1 mak zick

fore

whe prod viz. bein

Da

then multiply the Terms in the other Column continually, and let the last Product be a Divisor; then divide the said Dividend by the said Divisor, and the Quotient thence arising will be the Answer to the Question.

So the Example of the first of the said Cases being again repeated, viz. If 150 Pence at London make 3 Ducats at Naples, and 4 \$ Ducats at Naples make 34 \$\frac{1}{2}\$ Shillings at Brussels, then how many Pence at London are equal to 138

Shillings at Bruffe Is ?

The Term being placed according to the 7th Rule will fland as followeth:

Pence at Lond. 150 3 Ducats at Naples.

Ducats at Nap. 44 34 Shillings at Bruffels.

Shill. at Bruff. 138

Having thus placed the Terms, that in neither Column there is two Terms of one Kind, then observe that the Column under A hath most Terms in it, therefore they must be multiplied together for a Dividend, viz. 150 multiplied by 4\frac{4}{2} produceth \frac{1}{2}\frac{6}{2}\circ^{\circ}, which multiplied by 138, produceth \frac{4}{2}\frac{6}{2}\frac{8}{2}\frac{6}{2}, for a Dividend, then in the Column under B there are 3, and 34 \frac{1}{2}, which multiply'd together produce \frac{3}{2}\frac{7}{2}, the Quotient is 960 Pence for the Answer as before.

Again, Let the Example of the second Case be again repeated, viz. If 401. Averdupois-weight at London make 361. Weight at Amsterdam, and 901. at Amsterdam make 116 at Dantzick, then how many Pounds at Dantzick are equal to 1121. Averdupois-weight at London?

The Terms being disposed according to the 7th Rule

foregoing, will stand thus :

l. at London
l. at Amsterdam
90 116 l. at Amsterdam.
1. at Amsterdam

whereby I find that the Terms under B multiplied together, produce 497712 for a Dividend, and the Terms under A, viz. 40 and 90, produce 3600 for a Divisor, and Division being finished, the Quotient giveth 129\frac{1}{3}\frac{1}{5}

CHAP. XXXI.

Single Position.

that by which we find out a Truth, by Numbers invented or supposed, either Single or Double.

2. The Rule of Single Position, Is, when at once, viq. by one false Position, or seigned Number, we find out the

true Number fought.

3. In the Single Rule of False, when you have made choice of your Position, work it according to the Tenor of the Question, as if it were the true Number sought; and if by the ordering your Position you find either the Result too much or too little, you may then find out the Number sought by this Proportion following, viz.

As the Refult of your Position is to the Position, so is

the given Number to the Number fought.

Example.

Quest. 1. A Person having about him a certain Number of Crowns, said, If a 4th, 3d, and 6th of them were added together, they would make just 45 1. now I demand the Number of Crowns he had about him?

Answer 60 Crowns.

To resolve this Question, I suppose he had 24 Crowns (or any other Number that will admit of the like Division) now the 4th of 24 is 6, and the 3 is 8, and the 6th is 4, all which Parts, (6, 8, and 4) being added together, make but 18, but it should be 45, wherefore I say by the Rule of Three.

As 18 rhe Sum of the Parts is to the Position 24, so is 45 the given Number to 60 the true Number sought.

For the 4th of 60 is 15, and the 3d of 60 is 20, and the 6th of 60 is 10, which added together make 45.

C H A P.

CHAP. XXXII.

Double Position.

1. THE Rule of double Position is when two salse Positions are assumed to give a Resolution to the Question propounded.

2. When any Question is stated in double Position, make such a Cross as in the Margent.

2. Then make choice of any Number you think may be convenient for your working, which call your first Position, and place it at the End of the Cross at a; then work with this Position, and it were the true Number fought, according to the Nature of your Queftion; then having found out your Error, either too much or too little, place it od that Side the d, then make choice of another Number of the same Denomination with the first Position (which call your second Position) and place it on the Side of the Crofs at b; then work with this Position as with the former, and having found out your Error, either too much or too little, place it on that Side of the Cross at c; and then the Positions will stand at the Top of the Crofs, and the Errors at the Bottom, each under his correspondent Position, and then multiply the Errors into the l'ofition cross-wise, that is, multiply the first Position by the fecond Error, and the fecond Polition by the first Error, and put each Product over its Polition.

4. Having proceeded so far, then consider whether the Errors are both a like, that is, whether they are both too much, or both too little; and if they are alike; then subtract the lesser Product from the greater; and set the Remainder for a Dividend; then subtract the lesser Error from the greater, and set the Remainder be a Divisor and the Quo sent arising by this Division is the Answer to the

Question.

is

y

nd

P.

5. But if the Errors are unlike, that is one too much and the other too little, then add the Products of the Pofitions and Errors together, and their Sum shall be a Dividend, then add the Errors together, and their Sum shall

Chap. 32.

be a Divilor, and the Quotient arising hence is the Answer.

Quest. 1. A, B, and C built a House, which cost 76 1. of which A paid a certain Sum unknown, B paid as much as A, and 101. over, and C as much as A and B: Now I de-

fire to know each Man's Share in that Charge?

Having made a Cross according to the second Rule, I come according to the 3d Rule to make choice of my first Position, and here I suppose A paid 6 L which I put upon the Cross as you see, then B paid 16 L (for its said he paid to L more than A) and C paid 22 L (for it's said he paid as much as A and B) then I add their Parts.

1.		A 6
9		1 6
19		R 16
9 19 28	120 168 288	C 21
-	6779	
56	2) X (14 32 X 20	Sum 44
	32 1 20	
76	12	- 76
76 56 20		44
-		
20		Error 32

And they amount to 44, but it is said they paid 76 l. wherefore there is 32 too little, which I note down at the Bottom of the Cross under its Position for the first Error.

2dly, I suppose A paid 9 L then B paid 191. and C
28 L all which add together make 56, but they should
make 76, wherefore the Error of this Position is 20,
which I put at the Bottom of the Cross under its Position
for the 2d Error; then I multiply the Errors and Position
Cross-wise, viz. 32 (the Error of the first Position) by 9
(the 2d Position) and the Product is 288. Then I multiply 20, (the Error of the second Position) by 6 (the
rst Position) and the Product is 120.

Then (according to the 4th Rule) I subtract the lesser Product from the greater, viz. 120 from 288, because the Errors are both alike, (viz. too little) and there remaineth

e re-

Chap. 32. maineth 168 for a Dividend; then I Rubtract 22 (the leffer Error) from 32, the greater Error, and the Remainder is 12, for a Divitor, then I divide 168 by 12, and the Quotient is 14 for the Answer, which is the Share of A in the Payment.

6. Again, 2dly, If the Errors had been both too big, it had had the same Effect, as appeareth by the following Work: for first, I suppose A paid 20 1. then B paid 30 1. and C 501. which in all is 100 l. but it should have been no more than 76, wherefore the first Error is 24 too much. Again, I suppose A paid 18 l. then B must pay 28 l. and Cmust pay 46 l. which in all is 92 l. but it should have been but 76.

20 A B 28 30 B 50 C 320 112 432 C 46 100 Sum 5um 92 (14 Subtr. 76 76 Subtr.

24 Error Error 16 wherefore the 2d Error is 16 too much; then I multiply 20 (the first Position) by 16 (the 2d Error) and the Product is 320; again, I multiply 18 (the 2d Position) by 24 (the first Error) and the Product is 432. Then because the Errors are both too much, I subtract 320 (the lesser Product) from 432 (the greater Product) and there remaineth 112 for a Dividend; likewise I subtract 16 (the leffer Error) from 24 (the greater Error) and the Difference is 8 for a Divisor; then perform Division, and the Quotient is 14, as before for the Answer.

Again, 3dly, If the Errors had been the one too big, and the other too little, Respect being had to the fifth Rule foregoing, the Answer would have been the same; as thus, I take for my first Position 6, and then the Error is

32 too little; then I take for my fecond Position 18, and then the Error is 16 too 96 672 57 much, then I multiply the Positions and 6 Errors cross-wife, and the Product are 96 48) and 576, and because the Errors are unlike, viz. one too big, and another too setle, I add the Product 26 and 376 toge-

Chap. 32, ther, and their Sum is 672 for a Dividend; I likewife add the Errors 32 and 16 together, and their Sum is 48 for a Divisor; then having finished Division, I find the Quotient to be 14, which is the Answer, as was found out at the two feveral Trials before.

For	Proof	of the Work	, Ifay,
If A paid Then B paid Then C paid	d 14 an	nd 10 (that is)	14 24 38
	The S	um of all is -	76

which is the total Value of the Building, and equal to the

given Number.

Those who defire to see the Demonstration of this Rule, let them read the 7th Chapter of Mr. Kerfey's Appendir to Mr. Wingate's Arithmetick, Petiseus in the 5th Book of his Trigonometria, or Mr. Oughtred in his Clavis Methe matica.

Queft. 2. Three Persons A, B, and C, thus discoursed together concerning their Age; queth A, I am 18 Year of Age; quoth B, I am as old as A and half C; and quoth C, I am as old as you both, if your Years were added together. Now I defire to know the Age of each Person ?

Answer A is 18, B is 54, and C is 72 Years of Age.

Queft. 3. A Father lying at the Point of Death, left to his three Sons, viz. A, B, and C, all his Estate in Money, and divided it as followeth, viz. to A he gave half wanting 44 l. to B, he gave ; and 24 l. over, and to C he gave the Remainder, which was 831. less than the Share of B; now I demand what was the Sum left, and each Man's Part?

Answer. The Sum bequeathed was 588 1. wherefore A

had 2501. B had 2101. and Chad 1281.

Queft. 4. Two Perfons, viz. A and B had each in their Hands a certain Number of Crowns, and A faid to B If you give me one of your Crowns, I shall have five simes as many as you; and faid B to him again, If you 1146

treat peral mals there Answer A had a and B had two Crowns.

Quest. 5. What Number is that unto which if I add 1—4th of it self, and from the Sum subtract 1—8th of it self, the Remainder will be 216?

Answer 192.

to

ive

Many more Questions may be added, but these well understood, will be sufficient, (even from the meanest Capacity) for the Resolution of any other Question pertinent to this Rule.

There may be an Objection made, because we have not treated particularly upon Interest and Rebate; but the Operation of such Questions being more applicable to Decimals, are omitted, till we come to acquaint the Learner therewith.
